

Consumer Confidence Report Certification Form

Water System Name: Klamath Community Services District

Water System Number: 800548

The water system named above hereby certifies that its Consumer Confidence Report was distributed on _____ to customers (and appropriate notices of availability have been given). Further, the system certifies that the information contained in the report is correct and consistent with the compliance monitoring data previously submitted to the State Water Resources Control Board, Division of Drinking Water.

Certified by: Name: Margaret Caldwell
Signature: *Margaret Caldwell*
Title: President
Phone Number: (707) 460-3335 Date: May 11th, 2021/6/5/2021

To summarize report delivery used and good-faith efforts taken, please complete the below by checking all items that apply and fill-in where appropriate:

- X CCR was distributed by mail or other direct delivery methods. Specify other direct delivery methods used:
- X "Good faith" efforts were used to reach non-bill paying consumers. Those efforts included the following methods:

Posting the CCR on the Internet at www._____

- X Mailing the CCR to postal patrons within the service area 95548

Advertising the availability of the CCR in news media (attach copy of press release)

Publication of the CCR in a local newspaper of general circulation (attach a copy of the published notice, including name of newspaper and date published)

- X Posted the CCR in public places; Klamath Community Center, U.S. Post Office

- X Delivery of multiple copies of CCR to single-billed addresses serving several persons, such as apartments, businesses, and schools, Village RV Park

Delivery to community organizations (attach a list of organizations)

Other (attach a list of other methods used)

For systems serving at least 100,000 persons: Posted CCR on a publicly-accessible internet site at the following address: www._____

For privately-owned utilities: Delivered the CCR to the California Public Utilities Commission.

2020 Consumer Confidence Report

Klamath Community Services District

Water System Name: Klamath Community Services District **Report date:** May 11th, 2021

Types of water sources in use: Ground water wells, Green Diamond Well and Highway 101 wells.

Name and general locations of sources: Green Diamond Well in the Hoppaw Creek Basin (primary well). Highway 101 wells (West of Hwy 101) are not in use.

Drinking Water Source Assessments Information: Completed on the 101 wells in November of 2001. Green Diamond Wells completed in May of 2001. Copies of these assessments are available from the California Division of Drinking Water, (530) 224-4800.

Time and place of regularly scheduled board meetings for public participation: Meetings are held on the 3rd Wednesday of each month at 6pm at 600 Klamath Mill Road in Klamath California.

For more information contact: Margaret Caldwell (707) 460-3335

We test the drinking water quality for many constituents as required by State and Federal Regulations. This report shows the results for the period of January 1st - December 31st, 2020 and may include earlier monitoring data.

TERMS USED IN THIS REPORT

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Consumer Confidence Report

Variances and Exemptions: State Board permission to exceed an MCL or not comply with a treatment technique under certain conditions.

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter or (mg/L), ppb: parts per billion or micrograms per liter or ($\mu\text{g/L}$)

ppt: parts per trillion or nanograms per liter or (ng/L), ppq: parts per quadrillion or picogram per liter or (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1 and 2 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently.

TABLE 1 – SAMPLING RESULTS SHOWING THE DETECTION OF COLIFORM BACTERIA

Microbiological Contaminants (complete if bacteria detected)	No. of Detections during reporting year	No. of months in violation	MCL	MCLG	Typical Source of Bacteria
Total Coliform Bacteria	3	1	More than 1 sample in a month with a detection	0	Naturally present in the environment
Fecal Coliform or E. coli	0	0	A routine sample and a repeat sample detect total coliform and either sample also detects fecal coliform or E. coli	0	Human and animal fecal waste

TABLE 2 – SAMPLING RESULTS SHOWING THE DETECTION OF NITRATES

Contaminant	Sample Date	No. of samples collected	Level Detected	AL	PHG	Typical Source of Contaminant
Nitrates	5/22/2020	1	.81 ppm	10 ppm	0 ppm	Runoff from fertilizer use; leaking from septic tanks, sewage; erosion of natural deposits

*Any violation of an MCL or AL is asterisked. Additional information regarding the violation is provided later in this report.

TABLE 3— SAMPLING RESULTS SHOWING THE DETECTION OF INORGANIC CONTAMINANTS

Inorganic Contaminants	Sample Date	No. of samples collected	Level Detected	MCL	MCLG	Typical Source of Contaminant
Lead	8/20/2018 (Most Recent)	5	0.0034 ppb	0 90th percentile	0 ppm	Corrosion of household plumbing systems; erosion of natural deposits
Copper	8/20/2018 (Most Recent)	5	0.027 ppb	0 90th percentile	.013 ppm	Corrosion of household plumbing systems; erosion of natural deposits

Note: In addition to the above listed chemicals, we have tested for more than sixty other chemicals, all of which were either not detected at all or were in amounts well below Action Levels or Maximum Contaminant Levels.

Lead-Specific Language for Community Water Systems: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Klamath Community Services District is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Note: During the last quarter of 2020 the KCSO collected several water samples that tested positive for the presence of bacteria (Coliforms) possibly from rainwater intrusion in the storage facility. Although this was not a threat to public safety, it resulted in the requirement from the state that the KCSO install a chlorination system to bring the water system back into compliance with drinking water standards. Since the chlorination system came online in January of 2021 the water system has not collected any additional positive tests for Coliforms in your drinking water and all monthly samples collected to date meet state water quality standards.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Signed

Margaret Caldwell

KCSO President
