2016 Consumer Confidence Report

Water System Name: CSA 32 (Cantua Creek) Report Date: June 28, 2017

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2016 and may include earlier monitoring data.

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Type of water source(s) in use: Surface water from the California Aqueduct

Name & general location of source(s): CA Aqueduct

A source water assessment was conducted for the CALIFORNIA AQUEDUCT-RAW of the FCSA #32/CANTUA CREEK water system in April 2003. According to State Water Resources Control Board records, this Source is Surface Water. This Assessment was done using the Surface Water System (Watershed with Zones) Method. The Source is considered most vulnerable to the following activities not associated with any detected contaminants: Agricultural Drainage. Discussion of Vulnerability: The California Aqueduct is exposed to a wide variety of possible contaminants throughout its length. Of primary concern to FCSA#32/Cantua Creek are those activities occurring in the reach downstream from the San Luis Reservoir. Water entering the San Luis Reservoir and the O'Neill Forebay bring with it a mixture of contaminants accumulated in passage through the Sacramento Valley, the San Joaquin Delta and the inflow from many drainage inlets between the Delta and the Reservoir. Storm runoff and agricultural drainage inflow at many locations in this watershed could possibly reach the Aqueduct. In the O'Neil Forebay the Aqueduct water is mingled with water from the Federal Delta-Mendota Canal, which is also influenced by significant storm runoff and agricultural drainage. Contaminates can enter the Aqueduct in the reaches downstream of the San Luis Reservoir. Storm drainage from the east side of the Coast Range accumulates adjacent to the Aqueduct and is pumped into the Aqueduct for disposal. This drainage contains asbestos, agricultural drainage, oil field wastes and other potential chemicals from accidental spills. Westlands Water District enforces a policy that does not allow drainage water or return water off fields to reenter their delivery system. The district maintains an active Municipal and Industrial Back-Flow prevention program approved by the State Water Resources Control Board for those connections that require protective devices.

Drinking Water Source Assessment information: A copy of the complete assessment is available from the State Water Resources Control Board District Office located at 265 W. Bullard Ave Suite 101, Fresno CA 93704. You may request a summary of the assessment be sent to you by contacting the Supervising Regional Engineer at (559) 447-3300.

Time and place of regularly scheduled board meetings for public participation: <u>Public meetings are scheduled as</u> needed, please contact the Fresno County Department of Public Works & Planning for more information.

For more information, contact: Nayiri Moumdjian Phone: (559) 600-4259

TERMS USED IN THIS REPORT

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Variances and Exemptions: State Board permission to exceed an MCL or not comply with a treatment technique under certain conditions.

Level 1 Assessment: A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Level 2 Assessment: A Level 2 assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an *E. coli* MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter (mg/L)

ppb: parts per billion or micrograms per liter (μ g/L)

ppt: parts per trillion or nanograms per liter (ng/L)

ppq: parts per quadrillion or picogram per liter (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- *Inorganic contaminants*, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- *Pesticides and herbicides*, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

TABLE 1 –	SAMPLING	RESULT	S SHOW	VING THE DI	ETECTION	OF COLIF	ORM BACTERIA
Microbiological Contaminants (complete if bacteria detected)	Highest No. of Detections	- 101 0	nonths in ation	МО	CL	MCLG	Typical Source of Bacteria

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead-Specific Language for Community Water Systems: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. CSA 32 (Cantua Creek) is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. [Optional: If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants.] If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4701) or at http://www.epa.gov/lead.

Summary Information for Violation of a MCL, MRDL, AL, TT, or Monitoring and Reporting Requirement

Violation	Explanation	Duration	Actions Taken to Correct the Violation	Health Effects Language
Failure to meet the Total Trihalomethane MCL	Trihalomethane exceeds the Maximum Contaminant Level	1/13/16-10/4/16	Fresno County Public Works & Planning is in the early planning stages of doing a ground water project that will be funded through a grant received from the State Water Resources Control Board.	Some people who drink water containing Trihalomethanes and Haloacetic Acids in excess of the MCL over many years may experience liver, kidney, or central nervous system problems, and may have an increased risk of getting cancer.
Failure to meet the Haloacetic Acid MCL	Haloacetic Acid exceeds the Maximum Contaminant Level	1/13/16-10/4/16	Fresno County Public Works & Planning is in the early planning stages of doing a ground water project that will be funded through a grant received from the State Water Resources Control Board.	Some people who drink water containing Trihalomethanes and Haloacetic Acids in excess of the MCL over many years may experience liver, kidney, or central nervous system problems, and may have an increased risk of getting cancer.
Failure to meet the Lead and Copper Sampling and monitoring deadline	Routine triennial samples were not sampled in the given period. However, the tests were conducted in May of 2017.	1/1/16-12/31/16	Routine triennial samples were not sampled in the given period. However, the tests were conducted in May of 2017.	Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level over a relatively short amount of time may experience gastrointestinal distress. Some people who drink water-containing copper in excess of the action level over many years may suffer liver or kidney damage. People with Wilson's Disease should consult their personal doctor. Infants and children who drink water-containing lead in excess of the action level may experience delays in their physical and mental development. Children may show slight deficits in attention span and learning abilities. Adults who drink this water over many years may develop kidney problems or high blood pressure.

For Water Systems Providing Ground Water as a Source of Drinking Water

TABLE 7 – SAMPLING RESULTS SHOWING FECAL INDICATOR-POSITIVE GROUND WATER SOURCE SAMPLES						
Microbiological Contaminants (complete if fecal-indicator detected) Total No. of Detections Sample Dates MCL [MRDL] PHG (MCLG) [MRDLG] Typical Source of Contaminant						
E. coli	(In the year)		0	(0)	Human and animal fecal waste	
Enterococci	(In the year)		TT	n/a	Human and animal fecal waste	
Coliphage	(In the year)		TT	n/a	Human and animal fecal waste	

Summary Information for Fecal Indicator-Positive Ground Water Source Samples, Uncorrected Significant Deficiencies, or Ground Water TT

SPECIAL	SPECIAL NOTICE OF FECAL INDICATOR-POSITIVE GROUND WATER SOURCE SAMPLE						
None-Not Applicable

For Systems Providing Surface Water as a Source of Drinking Water

TABLE 8 - SAMPLING RESULTS SHOWING TREATMENT OF SURFACE WATER SOURCES				
Treatment Technique ^(a) (Type of approved filtration technology used)	Roberts Tri Media Filter			
-	Turbidity of the filtered water must:			
Turbidity Performance Standards ^(b) (that must be met through the water treatment process)	1 – Be less than or equal to <u>3</u> NTU in 95% of measurements in a month.			
	2 – Not exceed <u>3</u> NTU for more than eight consecutive hours.			
	3 – Not exceed 1.0 NTU at any time.			
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	100%			
Highest single turbidity measurement during the year	.110			
Number of violations of any surface water treatment requirements	None			

⁽a) A required process intended to reduce the level of a contaminant in drinking water.

⁽b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.

None								

Summary Information for Operating Under a Variance or Exemption

Summary Information for Federal Revised Total Coliform Rule Level 1 and Level 2 Assessment Requirements

Level 1 or Level 2 Assessment Requirement not Due to an E. coli MCL Violation

Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially harmful, waterborne pathogens may be present or that a potential pathway exists through which contamination may enter the drinking water distribution system. We found coliforms indicating the need to look for potential problems in water treatment or distribution. When this occurs, we are required to conduct assessment(s) to identify problems and to correct any problems that were found during these assessments.

During the past year we were required to conduct $\underline{\mathbf{zero}}$ Level 1 assessment(s). $\underline{\mathbf{Zero}}$ Level 1 assessment(s) were completed. In addition, we were required to take $\underline{\mathbf{zero}}$ corrective actions and we completed $\underline{\mathbf{zero}}$ of these actions.

During the past year <u>zero</u> Level 2 assessments were required to be completed for our water system. <u>Zero</u> Level 2 assessments were completed. In addition, we were required to take <u>zero</u> corrective actions and we completed <u>zero</u> of these actions.

None-Not Applicable			

Level 2 Assessment Requirement Due to an E. coli MCL Violation

E. coli are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Human pathogens in these wastes can cause short-term effects, such as diarrhea, cramps, nausea, headaches, or other symptoms. They may pose a greater health risk for infants, young children, the elderly, and people with severely-compromised immune systems. We found *E. coli* bacteria, indicating the need to look for potential problems in water treatment or distribution. When this occurs, we are required to conduct assessment(s) identify problems and to correct any problems that were found during these assessments.

We were required to complete a Level 2 assessment because we found *E. coli* in our water system. In addition, we were required to take **<u>zero</u>** corrective actions and we completed **<u>zero</u>** of these actions.
