requirements.

2022 Consumer Confidence Report

Water System Name: Callayomi County Water District Report Date: June 28, 2023

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2022 and may include earlier monitoring data.

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Type of water source(s) in use: Two groundwater wells Diamond D Well located on the Diamond D Ranch, and Well #3 Located at Name & general location of source(s): 20721 Big Canyon Rd.

Drinking Water Source Assessment information: A 2010 assessment is available at the District office.

Time and place of regularly scheduled board meetings for public participation: 3rd Thursday each month at 4:00 PM at the District office, 21282 Stewart Street

TERMS USED IN THIS REPORT

For more information, contact: Todd Fiora

Environmental Protection Agency (U.S. EPA).

necessary for control of microbial contaminants.

Maximum Contaminant Level (MCL): The highest level of

a contaminant that is allowed in drinking water. Primary

MCLs are set as close to the PHGs (or MCLGs) as is

economically and technologically feasible. Secondary MCLs

are set to protect the odor, taste, and appearance of drinking

Maximum Contaminant Level Goal (MCLG): The level of

a contaminant in drinking water below which there is no

known or expected risk to health. MCLGs are set by the U.S.

Public Health Goal (PHG): The level of a contaminant in

drinking water below which there is no known or expected

risk to health. PHGs are set by the California Environmental

Maximum Residual Disinfectant Level (MRDL): The

highest level of a disinfectant allowed in drinking water.

There is convincing evidence that addition of a disinfectant is

Maximum Residual Disinfectant Level Goal (MRDLG):

The level of a drinking water disinfectant below which there

is no known or expected risk to health. MRDLGs do not

reflect the benefits of the use of disinfectants to control

Primary Drinking Water Standards (PDWS): MCLs and

MRDLs for contaminants that affect health along with their

monitoring and reporting requirements, and water treatment

Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Variances and Exemptions: Permissions from the State Water Resources Control Board (State Board) to exceed an MCL or not comply with a treatment technique under certain conditions.

Level 1 Assessment: A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.

Level 2 Assessment: A Level 2 assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an E. coli MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter (mg/L)

ppb: parts per billion or micrograms per liter (μ g/L)

ppt: parts per trillion or nanograms per liter (ng/L)

ppq: parts per quadrillion or picogram per liter (pg/L)pCi/L: picocuries per liter (a measure of radiation)

Phone: (707) 987 2180

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- *Inorganic contaminants*, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- *Pesticides and herbicides*, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- *Radioactive contaminants*, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U.S. EPA and the State Board prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration regulations and California law also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

TABLE 1 – SAMPLING RESULTS SHOWING THE DETECTION OF COLIFORM BACTERIA										
Microbiological Contaminants (complete if bacteria detected)	Highest N Detectio		of Months Violation	MCL			MCLG	Typical Source of Bacteria		
Total Coliform Bacteria (state Total Coliform Rule)	(In a mor	nth)	0	1 positive monthly sample ^(a)			0	Naturally present in the environment		
Fecal Coliform or <i>E. coli</i> (state Total Coliform Rule)	(In the y	ear)	0	A routine sample and a repeat sample are total coliform positive, and one of these is also fecal coliform or <i>E. coli</i> positive			ove,	Human and animal fecal waste		
<i>E. coli</i> (federal Revised Total Coliform Rule)	(In the y	ear)	0	(b)			0	Human and animal fecal waste		
or system fails to analyze total co	re total colifor oliform-positiv	rm-positive and the repeat same the second sec	nd either is <i>E. c</i> ple for <i>E. coli</i> .				epeat samples followi	ng <i>E. coli</i> -positive routine sample COPPER		
Lead and Copper (complete if lead or copper detected in the last sample set)	Sample Date	No. of Samples Collected	90 th Percentil Level Detected	Exceeding	AL	PHG	No. of Schools Requesting Lead Sampling	Typical Source of Contaminant		
Lead (ppb)	8/1/22	10	ND	0	15	0.2	1 school, 4 samples	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits		
Copper (ppm)	8/1/22	10	0.13 mg/I	0	1.3	0.3	Not applicable	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives		

Typical Source of Contaminant Salt present in the water and is generall naturally occurring Sum of polyvalent cations present in the vater, generally magnesium and calcium, and are usually naturally occurring WATER STANDARD Typical Source of Contaminant Some people who drink water containin rihalomethanes in excess of the MCL over many years may experience liver, cidney, or central nervous system oroblems, and may have an increased isk of getting cancer Discharge of oil drilling wastes and from netal refineries: erosion of natural
aturally occurring Sum of polyvalent cations present in the vater, generally magnesium and calcium, and are usually naturally occurring WATER STANDARD Typical Source of Contaminant Some people who drink water containir rihalomethanes in excess of the MCL over many years may experience liver, cidney, or central nervous system problems, and may have an increased isk of getting cancer Discharge of oil drilling wastes and from

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead-Specific Language: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Callayomi County Water District is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4791) or at http://www.epa.gov/lead.

This Consumer Confidence Report (CCR) reflects changes in drinking water regulatory requirements during 2021. These revisions add the requirements of the federal Revised Total Coliform Rule, effective since April 1, 2016, to the existing state Total Coliform Rule. The revised rule maintains the purpose to protect public health by ensuring the integrity of the drinking water distribution system and monitoring for the presence of microbials (i.e., total coliform and E. coli bacteria). The U.S. EPA anticipates greater public health protection as the rule requires water systems that are vulnerable to microbial contamination to identify and fix problems. Water systems that exceed a specified frequency of total coliform occurrences are required to conduct an assessment to determine if any sanitary defects exist. If found, these must be corrected by the water system. The state Revised Total Coliform Rule became effective July 1, 2021.

Although E. coli was detected, the water system is not in violation of the E. coli MCL.

For Water Systems Providing Groundwater as a Source of Drinking Water

TABLE 7 – SAMPLING RESULTS SHOWING FECAL INDICATOR-POSITIVE GROUNDWATER SOURCE SAMPLES									
Microbiological Contaminants (complete if fecal-indicator detected)	Total No. of Detections	Sample Dates	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant				
E. coli	1 *	1/4/2022	0	(0)	Human and animal fecal waste				
	(In the year 2022)								

* The E. coli MCL does not apply to groundwater sample results when at least 99.99% inactivation of viruses is being provided through disinfection. Callayomi provides at least 99.99% inactivation of viruses at all times.
