2020 Consumer Confidence Report

Water System Name:I	River Ranch Raisins, RRR #14	Report Date: June 2021						
	uality for many constituents as required by iod of January 1 - December 31, 2020 and	State and Federal Regulations. This report shows the results may include earlier monitoring data.						
	ormación muy importante sobre su : 4087 N. Howard Avenue, Kerman, G	agua para beber. Favor de communicarse River CA,para asistirlo en enpanol.						
Type of water source(s) in us	e: Ground Water Well, System #2000	Ground Water Well, System #2000672						
Name & location of source(s)	Well 1, 6306 Road 26 ½, Madera,	Well 1, 6306 Road 26 ½, Madera, CA						
Drinking Water Source hassessment information:	ttp://swap.des.ucdavis.edu/TSinfo/output/	os2000672-001.pdf						
Time and place of regularly s	cheduled board meetings for public partic	pation:						
For more information, contac	ct: Courtney Gillespie	Phone: (559) 843-2294						

TERMS USED IN THIS REPORT:

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants

Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Variances and Exemptions: State Board permission to exceed an MCL or not comply with a treatment technique under certain conditions.

Level 1 Assessment: A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.

Level 2 Assessment: A level 2 assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an E. coli MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter (mg/L)

ppb: parts per billion or micrograms per liter (ug/L)

ppt: parts per trillion or nanograms per liter (ng/L)

pCi/L: picocuries per liter (a measure of radiation)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

- *Microbial contaminants*, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential
 uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals that are byproducts of industrial processes
 and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic
 systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, USEPA and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that must provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, or MRDL is asterisked. Additional information regarding the violation is provided later in this report.

Microbiological Contaminants (completed if bacteria detected)	Highest No. of detections	No. of months in violation	MCL		MCLG	Typical Source of Bacteria
Total Coliform Bacteria (state Total Coliform Rule)	(In a mo.) 2	1	1 positive mont (two or more po monthly sample violation of the	sitive es is a	0	Naturally present in the environment
Fecal Coliform and <i>E. coli</i> (state Total Coliform Rule)	(In the year) O	0	A routine sample and a repeat sample are total coliform positive, and one of these is also fecal coliform or <i>E. coli</i> positive		0	Human and animal fecal waste
E. coli (federal Revised Total Coliform Rule)	(In the year)	0	Routine and repare total colifor and either is E. or system fails samples follow positive routine system fails to coliform positive sample for E. c	m positive coli positive to take repeat ing E coli sample or analyze total ve repeat	0	Human and animal fecal waste
TABLE 2	2 - SAMPLIN	G RESULT	S SHOWING	THE DETE	CTION OF	LEAD AND COPPER
Lead and Copper (complete if lead or copper detected in the last sample set)	No. of samples collected	90 th percentile level detected	No. sites exceeding AL	AL	PHG	Typical Source of Contaminant
Lead (ppb) (Sampled 9/19)	5	ND	0	15	0.2	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natura deposits
Copper (ppm) (Sampled 9/19)	5	ND	0	1.3	0.3	Internal corrosion of household water plumbing systems; erosion of natural deposits; leaching from wood preservative

Typical Source of Contaminant

Chemical or Constituent

Sample

Level

Range of

MCL

PHG

(and reporting units)	Date	Detected	Detections		(MCLG)	
Sodium (ppm)				none	none	Salt present in the water and is generally naturally occurring
Hardness (ppm)				none	none	Sum of polyvalent cations present in the water, generally magnesium and calcium and are usually naturally occurring

TABLE 4 - DET	ECTION OF	CONTAMIN	ANIS WIII			ING WATER STANDARD
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant
Nitrate (as Nitrogen, N) (ppm)	1/20	4.6		10	10	Runoff and leaching from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Arsenic (ug/L)	10/18	2.3		10	0.004	Erosion of natural deposits; runoff from orchards; glass and electronics production wastes
Barium (ppm)	10/18	0.10		1	2	Discharge of oil drilling wastes and from metal refineries; erosion of natural deposits
Dibromochloropropane (DBCP) (ppb)	5/20	0.09		0.2	.0017	Banned nematocide that may still be present in soils due to runoff/leaching from former use on soybeans, cotton, vineyards, tomatoes, and tree fruit
Uranium (pCi/L)	9/18	3.7		20	0.43	Erosion of natural deposits
TABLE 5 - DETE	CCTION OF C	ONTAMINA	ANTS WITH	A SECON	DARY DRIN	KING WATER STANDARD
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Specific Conductance (us/cm)	6/19	510		1600	N/A	Substances that form ions when in water seawater influence

For Water Systems Providing Ground Water as a Source of Drinking Water

TABLE 7 – SAMPLING RESULTS SHOWING FECAL INDICATOR-POSITIVE GROUND WATER SOURCE SAMPLES								
Microbiological Contaminants (complete if fecal-indicator detected) Total No. of Detections Sample MCL [MRDL] MCL (MCLG) [MRDLG] Typical Source of Contamination								
E. coli	(In the year)		0	(0)	Human and animal fecal waste			

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. River Ranch Raisins (RR#14) is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4701) or at http://www.epa.gov/lead.

Summary Information for Contaminants Exceeding an MCL, MRDL, or AL, or a Violation of Any Treatment Technique or Monitoring and Reporting Requirement

**Our water system failed the drinking water standard for total coliform during September 2020 due to improper disinfection following construction in the water system. We have adopted improved disinfection procedures to ensure that this will not occur again.

We constantly monitor for various contaminants in the water supply to meet all regulatory requirements. As you can see by the tables, we have learned through our monitoring and testing that some secondary contaminants have been detected. Contaminants with secondary standards only affect the aesthetic quality of the water and do not pose a health risk
