2022 Consumer Confidence Report

Water System Information

Water System Name: City of Fort Bragg CA

Report Date: May 5, 2023

Type of Water Sources in Use: Surface Water

Name and General Location of Sources: Noyo River, Newman Gulch, Waterfall Gulch, Summers Lane

Reservoir

Drinking Water Source Assessment Information: A Sanitary Survey was done in 2019 and is available upon request

Time and Place of Regularly Scheduled Board Meetings for Public Participation: **Second and Fourth Mondays of the month at Town Hall at 6:00pm**

For More Information, Contact: Heath Daniels (707) 961-4141 hdaniels@fortbragg.com

About This Report

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 to December 31, 2022 and may include earlier monitoring data.

Importance of This Report Statement in Spanish

Language in Spanish: Este informe contiene información muy importante sobre su agua para beber. Favor de comunicarse City of Fort Bragg a 416 n. Franklin St. Fort Bragg Ca. 95437 (707)961-2823 para asistirlo en español.

Terms Used in This Report

Term	Definition
Level 1 Assessment	A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.
Level 2 Assessment	A Level 2 assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an <i>E. coli</i> MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.
Maximum Contaminant Level (MCL)	The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.
Maximum Contaminant Level Goal (MCLG)	The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (U.S. EPA).
Maximum Residual Disinfectant Level (MRDL)	The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
Maximum Residual Disinfectant Level Goal (MRDLG)	The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
Primary Drinking Water Standards (PDWS)	MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.
Public Health Goal (PHG)	The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.
Regulatory Action Level (AL)	The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Table 1. Sampling Results Showing the Detection of Lead and Copper

Complete if lead or copper is detected in the last sample set.

Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives	Not applicable	£.0	€.1	0	081.0	20	9/22/2021	Copper (ppm)
Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits	0	2.0	٩١	0	0.3>	20	1202/22/6	(bbp)
Typical Source of Contaminant	No. of Schools Requesting Lead Sampling	PHG	AL	No. Sites Exceeding AL	90 th Percentile Level Detected	No. of Samples Collected	Sample Date	Lead and Copper

Table 2. Sampling Results for Sodium and Hardness

Typical Source of Contaminant	(MCLG)	MCL	Range of Detections	Level Detected	Sample Date	Chemical or Constituent (and reporting units) Sodium (ppm)
generally naturally occurring Sum of polyvalent cations present		odojų	96		6606/06/11	
our or polyarien callons present in the water, generally magnesium and calcium, and are usually naturally occurring		əuoN	96	98	77/29/2025	Hardness (ppm)

Table 3. Detection of Contaminants with a Primary Drinking Water Standard

By-product of drinking water disinfection	Α/N	08	St-t3	8.08	3/12/6/2022	(ppb) TTHMs Total Trihalomethanes (ppb)
By-product of drinking water disinfection	∀/N	09	22-33	26.5	3/12,6/15,9/6,	Halocetic Acids
Soil runoff	∀/N	G	08.0	08.0	11/29/2022	Turbidity (UTU)
Typical Source of Contaminant	PHG (MCLG)	[WBDF] WCF	Range of Detections	Level Detected	Sample Date	Chemical or Constituent (and reporting units)

Table 4. Detection of Contaminants with a Secondary Drinking Water Standard

Erosion of natural deposits, residue from some surface water treatment process	∀/N	009	13	13	11/29/2022	Chloride (mg/l)
Typical Source for Source for Source	(MCLG)	SWCF	Range of Detections	Level Detected	Sample Date	Chemical or Constituent (and reporting units)

SWS CCR Revised January 2023

Term	Definition				
	MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.				
reatment Technique (TT	A required process intended to reduce the level of a contaminant in drinking water.				
	Permissions from the State Water Resources Control Board (State Board) to exceed an MCL or not comply with a treatment technique under certain conditions.				
ID Not detect	Not detectable at testing limit.				
ppm parts per n	parts per million or milligrams per liter (mg/L)				
bp bsuts ber b	parts per billion or micrograms per liter (µg/L)				
pt parts per t	parts per trillion or nanograms per liter (ng/L)				
bd berts per c	parts per quadrillion or picogram per liter (pg/L)				
Ci/L picocuries	picocuries per liter (a measure of radiation)				

Sources of Drinking Water and Contaminants that May Be Present in Source Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial confaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems,
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

Regulation of Drinking Water and Bottled Water Quality

In order to ensure that tap water is safe to drink, the U.S. EPA and the State Board prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration regulations and California law also establish limits for contaminants in bottled water that provide the same protection for public health.

About Your Drinking Water Quality

Drinking Water Contaminants Detected

Tables 2, 3, 4, 5, list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants less than once per year because the concentrations of these contaminants do not change trequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, frequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

SWS CCR Revised January 2023

Odor Threshold (TON)	11/29/2022	1	1	3	N/A	Naturally-occurring organic materials
Total Dissolved Solids (TDS) (ppm)	11/29/2022	84	84	500	N/A	Runoff/leaching from natural deposits
Specific Conductance (umhos/cm)	11/29/2022	130	130	1600	N/A	Substances that form ions when in water, sea water influence
Sulfate (mg/l)	11/29/2022	4.2	4.2	500	N/A	Runoff/Leaching from natural deposits, industrial wastes
Color (CU)	11/29/2022	10	10	15	N/A	Naturally-occurring organic materials
Turbidity (NTU)	11/29/2022	0.80	0.80	5	N/A	Soil runoff

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead-Specific Language: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. [Enter Water System's Name] is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. [Optional: If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants.] If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4791) or at http://www.epa.gov/lead.

For Systems Providing Surface Water as a Source of Drinking Water

Table 10. Sampling Results Showing Treatment of Surface Water Sources

Treatment Technique (a) (Type of approved filtration technology used)	Alternative			
Turbidity Performance Standards (b) (that must	Turbidity of the filtered water must:			
be met through the water treatment process)	1 – Be less than or equal to 0.200 NTU in 95% of measurements in a month.			
	2 – Not exceed 0.200 NTU for more than eight consecutive hours.			
	3 – Not exceed 1.0 NTU at any time.			
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	99.2%			
Highest single turbidity measurement during the year	0.783			
Number of violations of any surface water treatment requirements	0			

⁽a) A required process intended to reduce the level of a contaminant in drinking water.

⁽b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.
