

ROGINA WATER COMPANY

PUBLIC WATER SYSTEM NUMBER 2310002 **APRIL 15, 2019**

2018 CONSUMER CONFIDENCE REPORT

General Manager: Mr. Daniel Rogina ~ Phone: (707) 462~4056

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2018.

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Rogina Water Company Drinking Water Source Information:

Type of Water Source in Use: Groundwater

Name & Location of Sources: Well 02, Deep well, adjacent to the Russian River

Well 04, Deep well, adjacent to the Russian River Well 05, Deep well, adjacent to the Russian River Well 06, Deep well, adjacent to the Russian River Well 07, Deep well, adjacent to the Russian River

Drinking Water Source Assessment Information:

An assessment of the drinking water sources for Rogina Water Company determined that all wells are located in an unconfined aquifer adjacent to the Russian River. This location lies between a commercial gravel mining operation and vineyard. The sources are considered most vulnerable to the presence of sand and gravel mining activities. A copy of the complete assessment is available at the Rogina Water Company office, or at the California State Water Board, Division of Drinking Water, 50 D St, Rm 200, Santa Rosa, CA 95404. Their phone number is (707) 576-2145.

General Drinking Water Source Information

he sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally -occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

Organic chemical contaminants, Including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.

Radioactive contaminants, that can be naturallyoccurring or be the result of oil and gas production and mining activities.

n order to ensure that tap water is safe to drink, the USEPA and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline @ 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline @: (1-800-426-4791).

Important Notice Regarding Lead for Community Water Systems

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Rogina Water Company is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline: http://www.epa.gov/safewater/lead.

<u>Definitions of Terms</u> Used in This Report

Maximum Contaminant contaminants. Level (MCL): The Primary Drinking Water allowed in drinking contaminants PHGs (or MCLGs) as is and feasible. Secondary requirements. MCLs are set to protect Secondary Drinking

Maximum Contaminant affect taste, odor, or Level Goal (MCLG): The appearance level of a contaminant drinking in drinking water below Contaminants which there is no SDWSs do not affect known or expected risk the health at the MCL to health. MCLGs are levels. bу set U.S. Environmental (TT): (USEPA).

(PHG): The level of a drinking water. contaminant which there is no of a contaminant known or expected risk which, if exceeded, to health. PHGs are triggers treatment or set by the California other requirements Protection Agency.

<u> Maximum Residual Variances and</u> that addition of a certain conditions. necessary for control testing limit. microbial contaminants.

<u>Maximum</u> <u>Residual</u> <u>Disinfectant Level Goal</u> (MRDLG): The level of drinking water disinfectant below which there is no known or risk to MRDLGs do not reflect radiation).

the benefits of the use of disinfectants to control microbial

highest level of a <u>Standards</u> (PDWS): contaminant that is MCLs and MRDLs for water. Primary MCLs affect health along are set as close to the with their monitoring reporting economically and requirements, and technologically water treatment

the odor, taste, and Water Standards appearance of drinking (SDWS): MCLs for contaminants

t h e <u>Treatment Technique</u> A required Protection Agency process intended to reduce the level of a <u>Public Health Goal</u> contaminant

in Regulatory Action Level drinking water below (AL): The concentration Environmental that a water system must follow.

Disinfectant Level Exemptions: (MRDL): The highest Department level of a disinfectant permission to exceed allowed in drinking an MCL or not comply water. There is with a treatment convincing evidence technique under

disinfectant is <u>ND</u>: Not detectable at

ppm: parts per million or milligrams per liter (mg/L).

ppb: parts per billion or micrograms per liter $(\mu g/L)$.

expected pCi/L: picocuries per health. liter (a measure of

Summary Information for Violation of a MCL, MRDL, AL, TT, or Monitoring and None.. Reporting Requirement:

Tables 1, 2, 3, 4 AND 5 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.
