2021 Consumer Confidence Report

Water System Name: Echo Valley School WS Report Date: June 01, 2022

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2021 and may include earlier monitoring data.

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Type of water source(s) in use: One (1) groundwater well

Name & general location of source(s): Well # 2700552-003 (Well 02) is located in Northern Monterey County.

Drinking Water Source Assessment information: Available by Request

Time and place of regularly scheduled board meetings for public participation: Not available

For more information, contact: <u>Miles Farmer – Cypress Water Services</u> Phone: (831) 920-6796

Email: Service@cypresswaterservices.com

TERMS USED IN THIS REPORT

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Variances and Exemptions: State Board permission to exceed an MCL or not comply with a treatment technique under certain conditions.

Level 1 Assessment: A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.

Level 2 Assessment: A Level 2 assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an *E. coli* MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter (mg/L)

ppb: parts per billion or micrograms per liter (μg/L)

ppt: parts per trillion or nanograms per liter (ng/L)

ppq: parts per quadrillion or picogram per liter (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- · Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

TABLE 1 – SAMPLING RESULTS SHOWING THE DETECTION OF COLIFORM BACTERIA									
Microbiological Contaminants (complete if bacteria detected)	Highest No. of Detections	No. of months in			MCL		MCLG	Typical Source of Bacteria	
Total Coliform Bacteria (state Total Coliform Rule)	1	0		1 positive monthly sample		0	Naturally present in the environment		
Fecal Coliform or <i>E. coli</i> (state Total Coliform Rule)	0	0			A routine sample and a repeat sample are total coliform positive, and one of these is also fecal coliform or <i>E. coli</i> positive			Human and animal fecal waste	
E. coli (federal Revised Total Coliform Rule)	0	0			(a)		0	Human and animal fecal waste	
(a) Routine and repeat samples are total coliform-positive and either is <i>E. coli</i> -positive or system fails to take repeat samples following <i>E. coli</i> -positive routine sample or system fails to analyze total coliform-positive repeat sample for <i>E. coli</i> .									
TABLE 2	TABLE 2 – SAMPLING RESULTS SHOWING THE DETECTION OF LEAD AND COPPER								
Lead and Copper (complete if lead or copper detected in the last sample set)	Sample Date	No. of samples collected	90 th percenti level dete		No. sites exceeding AL	AL	PHG	Typical Source of Contaminant	
Lead (ppb)	9/2020	5	1		0	15	0.2	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits	
Copper (ppm)	9/2020	5 1.02			0	1.3	0.3	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives	
	TABLE	3 – SAMI	PLING R	ESU	LTS FOR S	SODIUM A	ND HARDI	NESS	
Chemical or Constituent (and reporting units)	Sample Date	Level Detected		Range of Detections		MCL	PHG (MCLG)	Typical Source of Contaminant	
Sodium (ppm)	2021	375		358 - 404		none	none	Salt present in the water and is generally naturally occurring	
Hardness (ppm)	1/2010	335				none	none	Sum of polyvalent cations present in the water, generally magnesium and calcium, and are usually naturally occurring	
TABLE 4 – DE	TECTION	OF CONT	ΓΑΜΙΝΑ	NTS	S WITH A <u>I</u>	PRIMARY	DRINKING	WATER STANDARD	
Chemical or Constituent (and reporting units)	Sample Date	Level Detected			Range of etections	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant	
Gross Alpha particle activity (pCi/L)	6/2011	9.87			N/A	15	(0)	Decay of natural and man-made deposits	
Haloacetic Acids (ppb)	2021	1.5		1 - 2		60	N/A	Byproduct of drinking water disinfection	
Total Trihalomethanes (ppb)	2021	380		36 - 359		80	N/A	Byproduct of drinking water disinfection	
Arsenic (ppb) (Raw Source)	2021	26.9		17 – 35.6		10	0.004	Erosion of natural deposits; runoff from orchards; glass and electronics production wastes	
Arsenic (ppb)* (Treated)	2021	5.5		0.9 – 14		10	0.004	Erosion of natural deposits; runoff from orchards; glass and electronics production wastes	
Barium (ppm)	6/2020	0.12		0.0705 - 0.174		2	2	Some people who drink water containing barium in excess of the MCL over many years may experience an increase in blood pressure.	
Chromium (ppb)	2021	1.3			N/A	50	100	Discharge of oil drilling wastes and from metal refineries; erosion of natural deposits	
Nickel (ppb)	2021	6.6			3.2 – 9.4	100	12	Erosion of natural deposits; discharge from metal factories	
Selenium (ppb)	2021	5.7			2.8 – 6.8	50	30	Discharge from petroleum, glass, and metal refineries; erosion of natural deposits; discharge from mines and chemical manufacturers; runoff from livestock lots (feed additive)	

TABLE 5 – DETECTION OF CONTAMINANTS WITH A <u>SECONDARY</u> DRINKING WATER STANDARD							
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL	Typical Source of Contaminant		
Iron (ppb) (RAW/Natural Source)	2021	1268	871 - 1710	300	Leaching from natural deposits; industrial wastes		
Iron (ppb) (Treated)	2021	59.19	0 - 664	300	Leaching from natural deposits; industrial wastes		
Manganese (ppb) (RAW/Natural Source)	2021	759	687 - 865	50	Leaching from natural deposits		
Manganese (ppb) (Treated)	2021	9.76	0 - 45	50	Leaching from natural deposits		
Total Dissolved Solids (TDS) (ppm)	1/2010	1204	N/A	1000	Runoff/leaching from natural deposits		
Specific Conductance (µS/cm)	9/2016	2300	2200-2400	1600	Substances that form ions when in water; seawater influence		
Chloride (ppm)	8/2018	705	N/A	500	Runoff/leaching from natural deposits; seawater influence		
Sulfate (ppm)	Sulfate (ppm) 8/2018 3		N/A 500		Runoff/leaching from natural deposits; industrial wastes		
Zinc (ppb)	2021	84.6	0 - 508	5,000	Runoff/leaching from natural deposits; industrial wastes		

^{*} While your treated drinking water meets the federal and state standard for arsenic, it does contain low levels of arsenic. The arsenic standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. The U.S. Environmental Protection Agency continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead-Specific Language for Community Water Systems: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. NMCUSD is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. [Optional: If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants.] If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4701) or at http://www.epa.gov/lead.

Summary Information for Violation of a MCL, MRDL, AL, TT, or Monitoring and Reporting Requirement

VIOLATION OF A MCL, MRDL, AL, TT, OR MONITORING AND REPORTING REQUIREMENT							
Violation	Explanation	Duration	Actions Taken to Correct the Violation	Health Effects Language			
Total Trihalomethanes (ppb)	Total Trihalomethanes exceeded running annual average for the 2021 year due to treatment system issues	2021 Year	Adjusted Treatment System To Maintain Chlorine Residual Along with Reduce TTHM Levels – Ongoing Increased Monitoring	When people consume trihalomethanes at high levels over many years, they increase their risk of developing bladder cancer. Other health effects that may be associated with trihalomethanes include rectal and colon cancer, and adverse developmental and reproductive effects during pregnancy.			
Arsenic	Levels temporarily above the Established MCL	February & March 2021	Notification on Site –	Some people who drink water containing arsenic in excess of the MCL over many years may experience skin damage or circulatory system problems, and may have an increased risk of getting cancer.			

Summary Information for Federal Revised Total Coliform Rule Level 1 and Level 2 Assessment Requirements

Level 1 or Level 2 Assessment Requirement not Due to an E. coli MCL Violation

Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially harmful, waterborne pathogens may be present or that a potential pathway exists through which contamination may enter the drinking water distribution system.

During the past year we were required to conduct 0 Level 1 assessment(s).

During the past year 0 Level 2 assessments were required to be completed for our water system.

Level 2 Assessment Requirement Due to an *E. coli* MCL Violation

E. coli are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Human pathogens in these wastes can cause short-term effects, such as diarrhea, cramps, nausea, headaches, or other symptoms. They may pose a greater health risk for infants, young children, the elderly, and people with severely-compromised immune systems.

We were **NOT** required to complete a Level 2 assessment because we **DID NOT** find *E. coli* in our water system. In addition, we were **NOT** required to take any corrective actions.
