2019 Consumer Confidence Report

Water System Name: Frank Family Winery Water System Report Date: June 09, 2020

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 to December 31, 2019 and may include earlier monitoring data.

Este informe contiene información muy importante sobre su agua para beber. Favor de comunicarse Frank Family Winery a 1091 Larkmead Lane, St. Helena CA para asistirlo en español.

这份报告含有关于您的饮用水的重要讯息。请用以下地址和电话联系 Frank Family Winery 以获得中文的帮助: 1091 Larkmead Lane, St. Helena CA, 707-942-0859.

Ang pag-uulat na ito ay naglalaman ng mahalagang impormasyon tungkol sa inyong inuming tubig. Mangyaring makipag-ugnayan sa Frank Family Winery 1091 Larkmead Lane, St. Helena CA o tumawag sa 707-942-0859 para matulungan sa wikang Tagalog.

Báo cáo này chứa thông tin quan trọng về nước uống của bạn. Xin vui lòng liên hệ Frank Family Winery tại 1091 Larkmead Lane, St. Helena CA để được hỗ trợ giúp bằng tiếng Việt.

Tsab ntawv no muaj cov ntsiab lus tseem ceeb txog koj cov dej haus. Thov hu rau Frank Family Winery ntawm 1091 Larkmead Lane, St. Helena CA rau kev pab hauv lus Askiv.

Type of water source(s) in use: Groundw	vater Well	
Name & general location of source(s): V	Vell #3 (28-01015-003) is located or	n the east side of the parcel adjacent to

TERMS USED IN THIS REPORT

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (U.S. EPA).

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Variances and Exemptions: Permissions from the State Water Resources Control Board (State Board) to exceed an MCL or not comply with a treatment technique under certain conditions.

Level 1 Assessment: A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.

Level 2 Assessment: A Level 2 assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an *E. coli* MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter (mg/L)

ppb: parts per billion or micrograms per liter (µg/L)

ppt: parts per trillion or nanograms per liter (ng/L)

ppq: parts per quadrillion or picogram per liter (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- *Inorganic contaminants*, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U.S. EPA and the State Board prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration regulations and California law also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

TABLE 1 – SAMPLING RESULTS SHOWING THE DETECTION OF COLIFORM BACTERIA							
Microbiological Contaminants (complete if bacteria detected)	Highest No. of Detections	No. of Months in Violation	MCL	MCLG	Typical Source of Bacteria		
Total Coliform Bacteria (state Total Coliform Rule)	(In a month)	1	1 positive monthly sample ^(a)	0	Naturally present in the environment		
Fecal Coliform or E. coli (state Total Coliform Rule)	(In the year)	0	A routine sample and a repeat sample are total coliform positive, and one of these is also fecal coliform or <i>E. coli</i> positive		Human and animal fecal waste		
E. coli (federal Revised Total Coliform Rule)	(In the year)	0	(b)	0	Human and animal fecal waste		

⁽a) Two or more positive monthly samples is a violation of the MCL

(b) Routine and repeat samples are total coliform-positive and either is *E. coli*-positive or system fails to take repeat samples following *E. coli*-positive routine sample or system fails to analyze total coliform-positive repeat sample for *E. coli*.

TABLE 2	TABLE 2 – SAMPLING RESULTS SHOWING THE DETECTION OF LEAD AND COPPER							
Lead and Copper (complete if lead or copper detected in the last sample set)	Sample Date	No. of Samples Collected	90 th Percentile Level Detected	No. Sites Exceeding AL	AL	PHG	No. of Schools Requesting Lead Sampling	Typical Source of Contaminant
Lead (ppb)	6/20/17	5	ND	0	15	0.2		Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits
Copper (ppm)	6/20/17	5	0.18	0	1.3	0.3	Not applicable	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives

SWS CCR Form Revised February 2020

		S – SAMPLING R	RESULTS FOR	SODIUM A	AND HARD	NESS
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Sodium (ppm)	1/14/15	41		None	None	Salt present in the water and is generally naturally occurring
Hardness (ppm)	1/14/15	74		None	None	Sum of polyvalent cations present in the water, generally magnesium and calcium, and are usually naturally occurring
TABLE 4 – DET	ECTION (OF CONTAMINA	NTS WITH A	PRIMARY	DRINKING	WATER STANDARD
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant
Arsenic*	5/10/18	36		10	(0)	Decay of natural and man-made deposits
Fluoride	2/8/18	0.23		2	1	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories
Gross Alpha	2/5/14	1.02		15	0.004	Erosion of natural deposits; runoff from orchards; glass and electronics production wastes
Aluminum	2/8/18	35		1000	0.6	Erosion of natural deposits; residue from some surface water treatment processes
Barium	2/8/18	32		1000	2	Discharge of oil drilling wastes and from metal refineries; erosion of natural deposits
Nickel	2/8/18	.71		100	12	Erosion of natural deposits; discharge from metal factories
TABLE 5 – DETE	CTION OF	CONTAMINAN	NTS WITH A S	ECONDAR	Y DRINKIN	G WATER STANDARD
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	SMCL	PHG (MCLG)	Typical Source of Contaminant
Bicarbonate	1/14/15	200				Anions of weak acids that contribute to the capacity of water to neutralize acids
Calcium	1/14/15	13				Erosion of natural deposits.
Magnesium	1/14/15	10				Erosion of natural deposits.
Iron	1/14/15	190		300		Leaching from natural deposits; industrial wastes.
Manganese*	1/14/15	750		50		Leaching from natural deposits
pH	1/14/15	7.3				pH is an indicator of the acid or alkaline condition of water.
Chloride	5/15/15	7.3				Erosion of natural deposits; seawater influence
Specific Conductance	1/14/15	370 uMhos		1600 uMhos		Substances that form ions when in water; seawater influence
Total Alkalinity (as CaCO3)	1/14/15	160				The alkalinity of water may be defined as its capacity to neutralize acid
Color	5/15/15	10		15		Naturally occurring organic materials
Odor	5/15/15	1		3		Naturally occurring organic materials
Sulfate	5/15/15	14				Leaching from natural deposits; industrial wastes.
Total Dissolved Solids	5/15/15	74				Leaching from natural deposits; industrial wastes.
Turbidity	5/15/15	4.4		5		Soil runoff
Zinc	5/15/15	7.3				Leaching from natural deposits; industrial wastes.

TABLE 6 – DETECTION OF UNREGULATED CONTAMINANTS						
Chemical or Constituent (and reporting units) Sample Date Level Detected Detections Range of Detections Notification Level Health Effects Language						
None to report						

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead-Specific Language: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Frank Family Winery is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking.

Summary Information for Violation of a MCL, MRDL, AL, TT, or Monitoring and Reporting Requirement

VIOLATION	VIOLATION OF A MCL, MRDL, AL, TT, OR MONITORING AND REPORTING REQUIREMENT						
Violation	Explanation	Duration	Actions Taken to Correct the Violation	Health Effects Language			
Arsenic in the well tested at 34ug/L on 12/30/19, over the Federal MCL of 10 ug/L	Arsenic in this system is believed to be naturally occurring and from the erosion of natural deposits	High arsenic in the raw well water has been an ongoing problem since An AdEdge arsenic remediation system installed in 2013 – see Actions Taken.	A new treatment system was brought live in 2013. Arsenic levels have been below the Federal MCL in the distribution system since. Monthly testing of the distribution system is done on an ongoing basis to ensure levels stay within limits.	Some people who drink water containing arsenic in excess of the MCL over many years may experience skin damage or circulatory system problems, and may have an increased risk of skin cancer.			
Manganese	Level of manganese was detected to be 750 ug/L, over the Federal MCL of 50 ug/L in Well 3 on 1/14/15	Ongoing since 1/14/15	System has EPA approved treatment to combat the high Manganese. Further testing of this well and the treated water was done during 2015 and it was determined the manganese levels are below the MCL in the distribution system	Exposure to high concentrations of manganese over the course of years has been associated with toxicity to the nervous system. Producing a syndrome resembling Parkinsonism. This type of effect may be more likely to occur in the elderly.			
Total Coliform	Total Coliform was detected in the distribution system on 5/28/19 & 5/30/19	2 Days	The system was flushed on 5/30/19 and resampled. System was free of Total Coliform.	Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially-harmful, bacteria may be present. Coliforms were found in more samples than allowed and this was a warning of potential problems.			

SWS CCR Form Revised February 2020

For Water Systems Providing Groundwater as a Source of Drinking Water

TABLE 7 – SAMPLING RESULTS SHOWING FECAL INDICATOR-POSITIVE GROUNDWATER SOURCE SAMPLES							
Microbiological Contaminants (complete if fecal-indicator detected)	Total No. of Detections	Sample Dates	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant		
E. coli	(In the year)		0	(0)	Human and animal fecal waste		
Enterococci	(In the year)		ТТ	N/A	Human and animal fecal waste		
Coliphage	(In the year)		TT	N/A	Human and animal fecal waste
