

## Consumer Confidence Report Certification Form

*(To be submitted with a copy of the CCR)*

Water System Name: Placer County Water Agency – Bianchi
---

Water System Number: CA 3110040
---------------------------------

The water system named above hereby certifies that its Consumer Confidence Report was distributed on May 2, 2024 – May 29, 2024, to customers (and appropriate notices of availability have been given). Further, the system certifies that the information contained in the report is correct and consistent with the compliance monitoring data previously submitted to the State Water Resources Control Board, Division of Drinking Water (DDW).

Certified by:

Name: Matt Young
------------------

Signature: 
--

Phone number: (530) 823-4850
------------------------------

Title: Director of Customer Services
--------------------------------------

Date: May 30, 2024
--------------------

To summarize report delivery, completed all items below:

- CCR was distributed by mail or other direct delivery methods. Specify other direct delivery methods used:
  - “Good faith” efforts were used to reach non-bill paying consumers. Those efforts included the following methods:
    - Posting the CCR on the Internet at <https://docs.pcwa.net/ccr/bianchi>
    - A direct link to the CCR for the Bianchi system was provided as a bill message on the customer’s bill, received in May: <https://docs.pcwa.net/ccr/bianchi>.
  - Posted CCR on a publicly accessible internet site at the following address: <https://docs.pcwa.net/ccr/bianchi>

## IMPORTANT MESSAGES AND INFORMATION

## WATER USE GALLONS PER DAY (GPD)

### AVERAGE GALLONS PER DAY (GPD)

## COMPONENTS ON A WATER BILL

The monthly Fixed Charge and the Renewal and Replacement Charge are payable whether or not any water is used. These charges are prorated based on number of days in the billing period.

**Fixed Charge and Water Tier Rates** - These charges fund Agency operations including personnel, operating supplies and services, state and federal mandates, purchased water, insurance, legal services, utilities, consulting, routine capital and other operation expenses.

**Renewal and Replacement Charge** - This charge funds construction projects to improve aging water infrastructure including water treatment plants, pipelines, canals or other water system facilities.

**Water Efficiency** - For more useful water use efficiency suggestions, please visit our site at <https://www.pcwa.net/smart-water-use>

### GO PAPERLESS!

Sign up today to receive text or email notifications when your bill is ready and pay online.

Follow these 3 easy steps to sign up for paperless billing:

1. Scan the QR code below, OR visit [pcwa.net](http://pcwa.net) and click on "Pay My Bill"
2. Log into your account or click "Register Now"
3. Toggle the "Paperless Billing" option to "Yes"

## FREQUENTLY ASKED QUESTIONS

**MOVING OR SELLING** - Please notify Customer Service at least three (3) days in advance. Tenants are responsible for all services provided and charges until date of termination/moving out. Property owners are responsible for all services provided and charges owed once a Tenant's termination notice is effective, and until close of escrow or recording of deed when the Property is sold.

**DOOR TAG CHARGE** - If, during the course of collection of past due charges, the Agency makes a trip to place a notice at the service location, there will be a charge applied to the billing account.

**BILLING QUESTIONS** - If you have any questions or to dispute your current bill, please call our Customer Services Center at (530) 823-4850 or (800) 464-0030 within ten (10) days from receipt of your bill statement. Our Customer Services Center hours are from 8:00 a.m. - 5:00 p.m., Monday - Friday, excluding holidays.

**DELINQUENT BILLS** - If you cannot pay the charges in full by the due date and need to make payment arrangements, please call the Customer Services Center prior to the due date. Our representatives may consider payment arrangements depending on individual circumstances. Multiple late payments may require an additional deposit.

**WATER QUALITY REPORTS** - To view your water quality report, please visit <http://www.pcwa.net/customer-services/water-quality.html> or contact customer service at (530) 823-4850 or (800) 464-0030.

## PAYMENT INFORMATION

Bills are due and payable a minimum of twenty-one days after the bill date. The following payment options are available for your convenience:

**Mail with a payment stub:** PO BOX 511377 LOS ANGELES, CA 90051-7932 Make checks payable to PCWA

**Mail without a payment stub:** PO BOX 6570 AUBURN, CA 95604-6570 **Credit card payments cannot be accepted by mail**

**Automated Phone Payment:** (530) 823-4850 or (800) 464-0030 Credit/Debit Card

**Online:** Credit/Debit card or electronic check payments can be made on the Agency payment portal. Visit [PCWA.net](http://PCWA.net) and follow the "PAY MY BILL" link at the top. The portal will allow you to sign up for automatic payments as well as paperless billing.

**In person:** 144 Ferguson Road Auburn, CA

Office hours: 8:00 a.m. to 5:00 p.m. Monday through Thursday, excluding holidays. The lobby is closed on Fridays.

**Night drop:** 144 Ferguson Road Auburn, CA

Available for after hours payments (checks or money orders only). Payments received after 8:00 a.m. are processed the next business day.

SCAN & PAY

# Water Quality Consumer Confidence Report

## For samples collected during 2023 in the Bianchi Water System

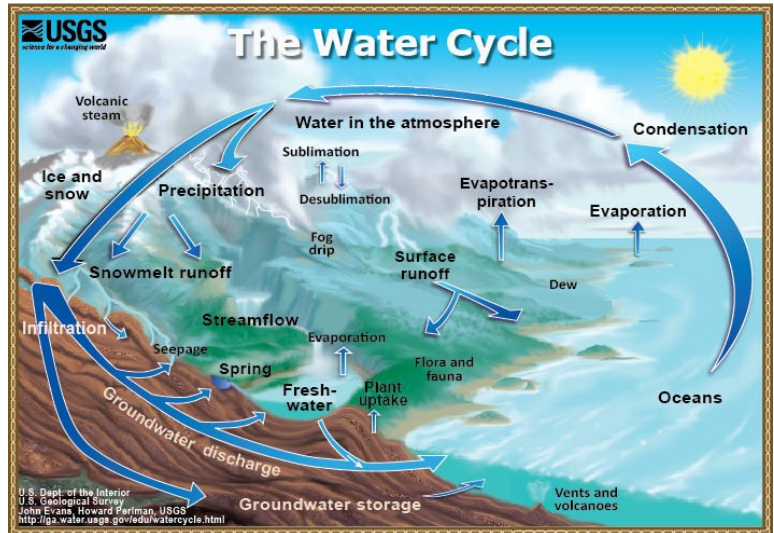

Placer County Water Agency is pleased to report this year that the drinking water supplied to you meets or exceeds state and federal public health standards for drinking water quality and safety. California water retailers, including PCWA, are required by law to inform customers about the quality of their drinking water. The results of PCWA's testing and monitoring programs of 2023 are reported in this newsletter. If you have any questions about this report, please contact the PCWA Customer Services Center at (530) 823-4850 or (800) 464-0030.

### Ensuring The Safety of Your Drinking Water

In order to ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (USEPA) and the State Water Resources Control Board (State Board) prescribe regulations which limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that must provide the same protection for public health.

### About Your Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. Environmental Protection Agency's **Safe Drinking Water Hotline: 1-800-426-4791**

### The Source of Your Water Supply

Your water originates in the Sierra snowpack. Surface water from the American River watershed flows into Folsom Lake. The PCWA Bianchi Service Area is supplied through agreement with the City of Roseville. A source water assessment was conducted for the City of Roseville's water supply from Folsom Lake in 2023. The source is considered most vulnerable to the following activities associated with contaminants detected in the water supply: Folsom Lake State Recreation Area facilities (marina, restrooms, recreational areas, parking lots, and storm drains) and residential sewer and septic systems. The source is considered most vulnerable to the following activities not associated with any detected contaminants: illegal activities and dumping, fertilizer, pesticide, and herbicide application, and high density housing developments. A If interested, a complete copy of the assessment can be obtained by calling the PCWA Customer Services Center at (530) 823-4850 or (800) 464-0030.

## DEFINITIONS AND TIPS: Understanding Your Water Quality Report

The table on the following page provides the results of water quality monitoring conducted during the previous calendar year. This page has been added to help ensure that this report is as clear to understand as possible, given the required content. We hope the following tips and definitions help to provide a clear understanding.

- Certain constituents are not required to be monitored annually because the levels are not expected to change from year to year. In those instances, the most recent results are provided.
- In accordance with the federal and state requirements, the table doesn't necessarily include results for all constituents tested during the previous calendar year by PCWA, only detected ones, and a few others which are commonly requested by customers.
- It is important to note that the table provides information about not only the results of monitoring we've performed, but also information about maximum allowable or recommended levels if they exist, so it is important to make sure the column you are reading is correct for the information you seek.
- If you are using the results in the table to compare to a set of standards you require (i.e. a new appliance, gardening, fish tanks, brewing beer or kombucha, etc.), it is very important to make sure you are using the correct unit of measure, which is also provided in the table. Those units of measure are also defined below.
- pH level is not included in the table because it varies based on time, temperature, and other factors. If you need to know the exact pH level, it should be collected at the point of use for an accurate measurement. The initial pH level is adjusted at the treatment facility. Based on scientific studies of our source water, PCWA aims for a pH range between 8.5-9 leaving the facility.
- The definitions below should be used to help you understand unfamiliar terms used in the table.
- If you come across any information that you'd like further explanation for, or are curious about please feel free to contact PCWA's customer service line at (530) 823-4850 or (800) 464-0030, and let them know you have questions for the Water Quality Supervisor.

**MCL: Maximum Contaminant Level.** The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste and appearance of drinking water.

**MCLG: Maximum Contaminant Level Goal.** The level of a contaminant in drinking water below which there is no known or expected risk to health. Set by the U.S. Environmental Protection Agency.

**PHG: Public Health Goal.** The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

**Primary Drinking Water Standard.** MCLs, MRDLs and treatment techniques for contaminants that affect health, along with their monitoring and reporting requirements, and water treatment requirements.

**MRDL: Maximum Residual Disinfectant Level.** The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

**MRDLG: Maximum Residual Disinfectant Level Goal.** The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

**AL: Action Level.** The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

**TT: Treatment Technique.** A required process intended to reduce the level of a contaminant in drinking water.

**NTU: Nephelometric Turbidity Units.** A measure of the clarity of water. Turbidity is monitored because it is a good indicator of water quality. High turbidity can hinder the effectiveness of disinfectants.

**pCi/L: picocuries per liter.** A measure of radiation.

**mg/L: milligrams per liter or parts per million (ppm), compare to 1 cup of water in a typical swimming pool**

**ug/L: micrograms per liter or parts per billion (ppb), compare to 1 drop of water in a typical swimming pool**

**uS/cm: MicroSiemens per centimeter**

**RAA: Running Annual Average**

**HRAA: Highest Running Annual Average**

**<: Less Than**

**ND: ND or Non-Detected:** An analysis result below detectable levels.

**NA: Non-Applicable**

# Bianchi Water Quality Results

## Primary Drinking Water Standards

The Bianchi neighborhood is served solely by City of Roseville water. PCWA does some water quality monitoring in the neighborhood and that data is reflected below. All other water quality data can be found on Roseville's Water Quality Report. Roseville's Water Quality Report can be found at the following link. Roseville is required to add 2023 water quality data by July 1, 2024. [City of Roseville water quality reports](#).

CONSTITUENT	# of Samples Collected	90th Percentile Level Detected	# of Sites Exceeding AL	# of Schools Tested	AL	PHG	Typical Source of Contaminant
Lead (ug/L) *Collected 2022	5	0	0	0	15	0.2	Internal corrosion of household plumbing systems
Copper (mg/L) *Collected 2022	5	0.1	0	N/A	1.3	0.3	Internal corrosion of household plumbing systems

CONSTITUENT	UNITS	MCL or [MRDL]	PHG, (MCLG) or [MRDLG]	Range and Average or (HRAA)	Typical Source of Contaminant
Total Trihalomethane	ug/L	80	None	31-41 (45.5)	Byproduct of drinking water disinfection
Total Haloacetic Acids	ug/L	60	None	6.2-33.9 (24.28)	Byproduct of drinking water disinfection
Chlorine	mg/L	[4]	[4]	0.23-0.77 (0.6)	Drinking water disinfectant added for treatment

## Environmental Influences on Drinking Water

The sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants**, such as salt and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- **Pesticides and herbicides**, that may come from a variety of sources such as agriculture, urban storm water runoff and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, agricultural application and septic systems.
- **Radioactive contaminants**, that can be naturally-occurring or be the result of oil and gas production and mining activities.

## Statement on Lead

### *(none found in this system)*

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. PCWA is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. Infants, young children, and pregnant women are typically more vulnerable to lead in drinking water than the general population. It is possible that lead levels at your home may be higher than at other homes in the community as a result of the materials used in your home's plumbing. If your water faucet has not been used for several hours, you can minimize the potential for lead exposure by flushing the faucet for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about elevated lead levels in your home's water, you may wish to have your water tested. Additional information is available from the USEPA Safe Drinking Water Hotline (1-800-426-4791) or at <http://www.epa.gov/safewater/lead>.

*Este informe contiene información muy importante sobre su agua potable. Tradúzcalo o hable con alguien que lo entienda bien.*

## Note to At-Risk Water Users

Some people may be more vulnerable to contaminants in drinking water than the general population. Immune-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/ Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791.

## What You Should Know About *Cryptosporidium*

*Cryptosporidium* is a microbial pathogen found in most surface waters. Although filtration removes *Cryptosporidium*, the most commonly used filtration methods cannot guarantee 100 percent removal. The City of Roseville tests for *Cryptosporidium* in the untreated water from Folsom Lake. During 2015-2017, *Cryptosporidium* was detected once at a level of 0.1 *Cryptosporidium*/Liter. Again, these results are from the untreated, raw water. The design of the EPA study conducted here did not call for treated water samples. Current test methods do not allow us to determine if the organisms are dead or if they are capable of causing disease. Ingestion of *Cryptosporidium* may cause an abdominal infection. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks. However, immune-compromised people are at greater risk of developing life-threatening illness. We encourage immune-compromised individuals to consult their health care provider regarding appropriate precautions to take to avoid infection. *Cryptosporidium* must be ingested to cause disease, and it may be spread through means other than drinking water.

## 2023 Testing Results

Measurements reported here were collected in 2023 (unless otherwise noted). In accordance with federal regulations, data is from the most recent tests. We are allowed to monitor for some contaminants less than once per year because concentrations of these contaminants do not change frequently.

# Frequently Asked Questions About Water Quality

*It is important for you to know that we take our customers' concerns very seriously. We feel that you wouldn't be calling if there weren't cause for concern, so we investigate every claim fully and in a timely manner before closing a case. Below are some answers to the most common questions or concerns. FOR INFORMATION about this report or to report any concerns with the quality of water in your home or a perceived risk to the quality of our water source, PCWA customers are invited to contact the PCWA Customer Service Center at (530) 823-4850 or (800) 464-0030.*

## Do we have hard water?

No, at less than 60 mg/L (milligrams per liter) PCWA water is considered soft water. General guidelines for classification of waters are: 0 to 60 mg/L as calcium carbonate is classified as soft; 61 to 120 mg/L as moderately hard; 121 to 180 mg/L as hard; and more than 180 mg/L as very hard.

## Is there Fluoride in my water?

PCWA does not fluoridate its water. There is a very small portion of the City of Rocklin, which receives water from the City of Roseville during high demand in warm months only. In addition, our Bianchi system receives Roseville water at all times. Roseville is required to fluoridate its water. To find maps of these areas, you can go to:

<https://www.pcwa.net/services/water-quality>

## My water smells like Chlorine!

Chlorine is required in the distribution system to keep bacteria from making it to your tap. We regulate our Chlorine dosage very strictly so that we have just enough without having too much. The maximum level for Chlorine is 4 mg/L (milligrams per liter), and a common level for our systems is between 0.5 and 1 mg/L. Some people are more sensitive to the smell of Chlorine in water. It is common for people to think that the level of the Chlorine must be too high under these circumstances; however, we've found that the most common reason for smelling Chlorine at your tap is when the Chlorine is dissipating or the level is dropping. The reason for this is that the water sits in your plumbing before you use it. Most likely, if you flush your taps out, the smell will disappear.

## Why is my tap water milky or cloudy?

This is caused by tiny air bubbles in the water. It is completely harmless. Cold water from snowmelt has the potential to hold lots of air. As the water warms a bit on its way to your tap, it has more potential to release that air. When you turn on your tap, the rapid reduction in pressure causes the air to come out of solution, and creates the milky look you see. If this is the case, it will clear before your eyes as in the picture.

## How do I know my water is safe?

Distribution operators and treatment plant operators certified by the State Water Resources Control Board collect hundreds of bacteriological samples each year throughout the water distribution systems as well as performing thousands of individual tests in the treatment facilities and in the distribution system, of which the only the detected constituents are found in your annual Consumer Confidence Report. Field tests for things like temperature, turbidity, pH and chlorine residual help to let us know that our water is maintaining its quality throughout the distribution system.

# Frequently Asked Questions About Water Quality

*Continued...*

## My water is dirty!

It is actually very common for people to experience discolored or “dirty” water at their tap. In most cases, we can trace this condition to a particular aspect of the household plumbing. It is very common for a water heater to corrode or rust and cause discolored water in the hot water. You can test this by turning your tap to the full hot position and observe whether the water is discolored. If the water is discolored in your hot water, but not cold, you can be reasonably certain the issue lies in your water heater. If the problem occurs in the cold water as well, and doesn’t clear up after running for a few minutes, we may need to flush the main line. If you get discolored water out of your cold water tap and it clears up after running for several minutes, the main line is likely clean and you may have a plumbing fixture or an old galvanized line causing the problem.

## My water tastes like chemicals!

Another common call we get is that the water has a strong chemically taste all of a sudden. Most times, this can be traced to the either the Chlorine topic covered earlier, or to a hose bib being left on. This is most common during warm times of year when the hot sun beats down on a pressurized hose and creates backpressure. When you open a tap inside the house, you can be sure that high pressure hose water feeds right into your house, and it doesn’t taste good. The best way to avoid this is to always shut your hose off at the hose bib shut-off valve, and depressurize your hose. For this reason, it is not a good idea to have your hose bib set up as it is in the picture.

## How is my water treated?

Your water is treated by conventional methods, utilizing coagulation, flocculation, sedimentation, filtration, and finally disinfection. The facility or facilities serving your area are operated by State Water Resources Control Board certified operators. It may also be comforting for you to know that our facilities have built-in fail-safes which will immediately shut the treatment process down and not allow any water to the system if some-thing within the facility is not operating correctly. The operators receive alarms for immediate intervention so they can begin treating water again.

## Why are there pink or dark stains in my toilet or around my drains?

There are numerous bacteria, fungi, and other organisms in the environment that find their way onto bathroom and kitchen fixtures. Most are not pathogenic (disease causing). They are found in soil, food, and on animals, and they may become airborne because of construction or wind. Some thrive on moisture and need little else to grow. They may be noticed at the water line in toilet bowls or toilet tanks, on faucets, in sinks, or on shower tiles. They sometimes appear jelly-like and are grey, black, or even pink in color. The pink-colored one is interesting and often gets the attention of the customer. This is most likely from the bacteria *Serratia marcescens* and is from the environment, not the water supply. Room or whole-house humidifiers can be the source of airborne bacteria. Regular cleaning, periodic disinfection with household bleach or cleaner, and adequate ventilation are necessary to control these organisms.

# Frequently Asked Questions About Water Quality

*Continued...*

## Contaminants of Emerging Concern

PCWA has been receiving more questions as of late regarding some contaminants which are currently moving through the regulatory process, but aren't yet regulated.

### What are PFAS chemicals?

Per- and polyfluoroalkyl substances (PFAS) are a group of more than 12,000 human-made substances that are not naturally occurring and are resistant to heat, water, and oil. These chemicals have been used and produced extensively in the United States for both commercial and industrial purposes, as well as for emergency fire response. Due to their unique chemistry, PFAS have been widely used as surface coatings and protectant formulations in consumer goods such as carpet and home textiles; clothing; food packaging; and non-stick cookware. PFAS have also been used as a surfactant in chrome plating, firefighting foam, and other industrial applications. In typical conditions, PFAS are resistant to degradation and do not break down in the environment. These substances can accumulate within the human body and are toxic at relatively low concentrations.

### Is PCWA monitoring for them?

Yes! The 5th Unregulated Contaminant Monitoring Rule (UCMR5) is currently underway. The Safe Drinking Water Act requires that the EPA establish requirements for public water systems (PWSs) to monitor for priority unregulated contaminants every five years. PCWA is required to test at 4 of our treatment facilities, representing the water in our area. PCWA has found no detections in samples collected thus far in our treated surface water. This latest round of testing for PFAS chemicals is not the first time we've tested for them, but it is much more comprehensive and detection levels are far more sensitive than previous testing. UCMR3 also required testing for some PFAS chemicals, and we found no detections during that testing either.

## Contaminants of Emerging Concern

*Continued...*

### What are Microplastics?

'Microplastics in Drinking Water' are defined as solid polymeric materials to which chemical additives or other substances may have been added, which are particles which have at least two dimensions that are greater than 1 and less than 5,000 micrometers ( $\mu\text{m}$ ). Polymers that are derived in nature that have not been chemically modified (other than by hydrolysis) are excluded. Evidence concerning the toxicity and exposure of humans to microplastics is in early stages of understanding and rapidly evolving, and the proposed definition of 'Microplastics in Drinking Water' is subject to change in response to new information. The definition may also change in response to advances in analytical techniques and/or the standardization of analytical methods.

Microplastics can come from a variety of sources including larger plastic pieces that have broken apart, resin pellets used for plastic manufacturing, or in the form of microbeads, which are small, manufactured plastic beads used in health and beauty products.

### Is PCWA monitoring for them?

Not yet. Just as the understanding of the health effects of microplastics is still developing, the testing methods are still being developed and refined as well. We do expect further direction regarding the testing of microplastics in the not too distant future. Stay tuned!
