2022 Consumer Confidence Report

Water System Name:

City of Portola

Report Date: 25.August.2023

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2022 and may include earlier monitoring data.

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Type of water source(s) in use: In 2022, groundwater from springs and surface water from Lake Davis.

Name & general location of source(s):

During 2022, the water for the city came from Willow Springs and the Lake

Davis Water Treatment Plant.

Drinking Water Source Assessment information:

An assessment was completed between July 2002 and August 2003. A copy can be obtained by calling the Department of Public Health at (530) 224-4800. The Commercial Street Well was found to be the most vulnerable to the following activities associated with detected contaminants: contractor or government agencies equipment storage yard: sewer collection system. Our sources were found to be the most vulnerable to the following activities not associated with any detected contaminants: Managed Forests, Photo processing/printing: railroad yard/ maintenance/ fueling areas; utility stations-

maintenance areas.

Time and place of regularly scheduled board meetings for public participation:

Second and Fourth Wednesday of

every month.

For more information, contact: Todd Roberts

Phone: (530) 832-6809

TERMS USED IN THIS REPORT

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Variances and Exemptions: State Board permission to exceed an MCL or not comply with a treatment technique under certain conditions.

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter (mg/L)

ppb: parts per billion or micrograms per liter (µg/L)

ppt: parts per trillion or nanograms per liter (ng/L)

ppq: parts per quadrillion or picogram per liter (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, 7, and 8 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.

TABLE 1 –	SAMPLING	RESULTS	S SHOW	ING THE DE	TECTION	OF COLIF	ORM BACTERIA
Microbiological Contaminants (complete if bacteria detected)	Highest No. of Detections	No. of months in violation		MC	MCL		Typical Source of Bacteria
Total Coliform Bacteria	(In a mo.)	0			More than 1 sample in a month with a detection		Naturally present in the environment
Fecal Coliform or E. coli	(In the year)	0		repeat sample total coliform sample also	A routine sample and a repeat sample detect total coliform and either sample also detects fecal coliform or <i>E. coli</i>		Human and animal fecal waste
TABLE 2 - SAMPLING RESULTS SHOWING THE DETECTION OF LEAD AND COPPER							
Lead and Copper (complete if lead or copper detected in the last sample set)	Sample Date	No. of samples collected	90 th percenti level detecte	AL	AL	PHG	Typical Source of Contaminant
Lead (ppb)	9/22/2020	10	> .002	0	15	0.2	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits
Copper (ppm)	9/22/2020	10	0.17	0	1.3	0.3	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
	TABLE 3	- SAMPL	ING RE	SULTS FOR	SODIUM A	ND HARD	NESS
Chemical or Constituent (and reporting units)	Sample Date			Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Sodium (ppm)	2/23/2022	6.0		6.0	none	none	Salt present in the water and is generally naturally occurring
Hardness (ppm)	2/23/2022	68		68	none	none	Sum of polyvalent cations present

2016 SWS CCR Form Revised Jan 2015

	in the water, generally magnesium
	and calcium, and are usually
	naturally occurring

TABLE 4 – DET	ECTION OF	F CONTAMINA	NTS WITH A P	RIMARY	DRINKING	WATER STANDARD
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant
Barium (ppm)	2014- 2015	0.04	0.04	2.0	2.0	Erosion of natural deposits: discharge from metal refineries
Nitrate (ppm)	8/30/2022	0.09	< 0.05 - 0.09	10	10	Runoff and leaching from fertilize use; leaching from septic tanks, sewage and natural deposits
Gross Alpha (pCi/L)	8/11/2020	0.374	0.374	15	0	Erosion of natural deposits
Radium 228 (pCi/L)	2015	0.904	.904	5	0	Erosion of natural deposits
Haloacetic Acids (ppb) HAA5	Quarterly 2022	9.6 (AVG)	<nd -="" 14.0<="" td=""><td>60</td><td></td><td>Byproduct of drinking water disinfection</td></nd>	60		Byproduct of drinking water disinfection
Total Trihalomethanes TTHM (ppb)	Quarterly 2022	16.6 (AVG)	8.7 – 27	80		Byproduct of drinking water disinfection
TABLE 5 – DETE	ECTION OF	CONTAMINA	NTS WITH A SI	CONDAR	Y DRINKIN	G WATER STANDARD
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminan
Chloride (ppm)	2/23/2022	1.2	1.2	500		Runoff leaching from natural deposits; seawater influence
Iron (ppb)	2/23/2022	<0.05	<0.05	300*		Leaching from natural deposits; industrial waste
Total Dissolved Solids (ppm)	4/13/2022	86.3 (AVG)	102.6 - 127.7	1000		Runoff/ Leaching from natural deposits
Zinc (ppb)	8/13/2020	<0.02	<0.02	5000		Runoff/ leaching from natural deposits; industrial waste

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead-Specific Language for Community Water Systems: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Portola is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has

2016 SWS CCR Form Revised Jan 2015 been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

For Systems Providing Surface Water as a Source of Drinking Water

TABLE 8 - SAMPLING RESULTS SHOWING TREATMENT OF SURFACE WATER SOURCES			
Treatment Technique (a) (Type of approved filtration technology used)	Membrane Filtration		
Turbidity Performance Standards ^(b) (that must be met through the water treatment process)	Turbidity of the filtered water must: 1 – Be less than or equal to .1 NTU in 95% of measurements in a month. 2 – Not exceed 1 NTU for more than eight consecutive hours. 3 – Not exceed 1 NTU at any time.		
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	100%		
Highest single turbidity measurement during the year	0.88 NTU		
Number of violations of any surface water treatment requirements	0		

⁽a) A required process intended to reduce the level of a contaminant in drinking water.

Summary Information for Operating Under a Variance or Exemption

N/A

2016 SWS CCR Form Revised Jan 2015

⁽b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.
