

RICHARD SVINDLAND President

A Message from California American Water President RICHARD SVINDI AND

Dear California American Water Customer.

Having easy access to safe, clean water is something that can be easily taken for granted. At California American Water, our top priority is providing safe, reliable drinking water to our more than 690,000 customers.

I am pleased to share with you our 2018 Consumer Confidence Report, which is a testament to the hard work and dedication of our employees who ensure high-quality drinking water.

QUALITY: We have rigorous safeguards in place to ensure the water we provide to you meets or surpasses increasingly stringent water quality standards. Across California, we conducted approximately 652 different tests on 25,239 water samples for 2,994 constituents last year. We are proud and pleased to confirm that we met every primary and secondary state and federal water quality standard.

SERVICE: Last year, we invested more than \$74 million in water infrastructure in the California communities we serve. This investment ensures and maintains the safety and reliability of the facilities and technology needed to draw, treat, and distribute water.

VALUE: While costs to provide water service continue to increase across the country, our investments help us provide high-quality water service that remains an exceptional value, costing customers about a penny per gallon.

We are proud to continue to supply water that meets or surpasses all state and federal water quality standards. If you have any questions or concerns, you can contact us by phone, email, online at www.californiaamwater.com, or in person at our local Customer Center. Please take the time to review this report. It provides details about the source and quality of your drinking water, using data from water-quality testing conducted for your local system between January and December 2018.

Sincerely,

RICHARD SVINDLAND

June Clarke

President

Once again, we proudly present our Annual Water Quality Report, also referred to as a Consumer Confidence Report (CCR). This CCR covers compliance testing completed through December 2018. We are pleased to tell you that our compliance with state and federal drinking water regulations remains exemplary. As in the past, we are committed to delivering the best quality drinking water. To that end, we remain vigilant in meeting the challenges of source water protection, water conservation, environmental compliance, sustainability and community education while continuing to serve the needs of all our water users.

ABOUT CALIFORNIA AMERICAN WATER (CAW) AND AMERICAN WATER (AW)

California American Water, a subsidiary of American Water (NYSE: AWK), provides high-quality and reliable water and/or wastewater services to more than 690,000 people. With a history dating back to 1886, American Water is the largest and most geographically diverse U.S. publicly traded water and wastewater utility company. The company employs more than 7,100 dedicated professionals who provide regulated and market-based drinking water, wastewater and other related services to more than 14 million people in 46 states and Ontario, Canada. American Water provides safe, clean, affordable and reliable water services to our customers to make sure we keep their lives flowing. For more information, visit amwater.com and follow American Water on Twitter, Facebook and LinkedIn.

The Consumer Confidence Report (CCR) is an annual water quality report containing data that California American Water and all associated water purveyors collected during the past year. CCRs let consumers know what contaminants, if any, are in their drinking water as well as any related health effects. CCRs also include details about where your water comes from and how it is treated. Additionally, they educate customers on what it takes to deliver safe drinking water and highlight the need to protect drinking water sources.

In 2018, we collected numerous samples at various sampling points in your water system. The water quality data presented is a combination of data compiled from our nationally recognized water quality laboratory and local commercial laboratories; all certified in drinking water testing by the State Board's Division of Drinking Water. If you have any questions about this report or your drinking water, please contact our Customer Service Center at (888) 237-1333.

The Suburban-Rosemont water system is served by deep wells that pump groundwater from aquifers here in the Sacramento Valley. California American Water uses various drinking water treatment technologies to treat the groundwater used in the Suburban-Rosemont system including granular activated carbon (GAC) to remove low levels of organic chemical contaminants, fluoridation to promote dental health, iron and manganese removal, and chlorination of the water to ensure that the water supply meets bacteriological quality standards.

In 2018, California American Water purchased surface water from the City of Sacramento for the Suburban-Rosemont system. The water from the City of Sacramento originates from the American and Sacramento Rivers. These surface water supplies are treated by conventional treatment technologies including coagulation, sedimentation and filtration (using sand and anthracite filters), lime addition for corrosion control, fluoridation to promote dental health, and chlorination for disinfection. The water supply is distributed for residential and commercial use.

NOTICE OF SOURCE WATER ASSESSMENT (SWA)

An assessment of the drinking water sources in the Suburban system was completed in February 2003. The sources are considered most vulnerable to the following (associated with detected chemicals): sewer collection systems, known contaminant plumes, military installations, fertilizer, and pesticide/herbicide application.

Although not associated with any detected chemicals, the sources are also considered vulnerable to dry cleaners, plastics/synthetics producers, automobile gas stations, underground storage tanks (confirmed leaking tanks), metal plating/finishing/fabricating, and chemical/petroleum processing/storage.

A copy of the completed assessment may be viewed at California American Water, 4701 Beloit Drive, Sacramento, CA 95838.

Assessments of potential contaminating activities for the City's Sacramento River and American River water sources were completed in December 2010 and December 2008, respectively. These reports indicated that both rivers are most vulnerable to contaminants from recreational activities, urban runoff, industrial discharge, and that the Sacramento River is vulnerable to agricultural contaminants. A copy of the complete assessment is available for review in the City Clerk's office at City Hall or call (916) 808-5011 to request a summary of the assessments.

The sources of drinking water include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and can pick up substances resulting from animal or human activity and even radioactive material. In order to ensure that tap water is safe to drink, USEPA and the State Water Resources Control Board set regulations limiting the amount of certain contaminants in water provided by public water systems. Contaminants that may be present in source water include:

ORGANIC CHEMICAL CONTAMINANTS

including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and may also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.

INORGANIC CONTAMINANTS.

such as salts and metals, which can be naturally occurring or may result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

PESTICIDES AND HERBICIDES,

which may come from a variety of sources, such as agriculture, urban stormwater runoff, and residential uses.

MICROBIAL CONTAMINANTS.

such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

RADIOACTIVE CONTAMINANTS,

which can be naturally occurring or may be the result of oil and gas production and mining activities.

FLUORIDE

Fluoride is a naturally occurring substance. It can be present in drinking water from two sources:

- **1. By nature** when groundwater comes into contact with fluoride-containing minerals naturally present in the earth; or
- 2. By a water purveyor through addition of fluoride to the water they are providing in the distribution system.

In the Suburban-Rosemont system, fluoride is added to the water supply at concentrations based on state fluoride regulations managed by the State Water Resources Control Board, Division of Drinking Water and the Office of Oral Health. According to these agencies, when fluoride is present in drinking water at optimal levels, it has been shown to promote oral health by preventing tooth decay.

UNREGULATED CONTAMINANT MONITORING RULE (UCMR)

The USEPA created the Unregulated Contaminants Monitoring Rule (UCMR) to assist them in determining the occurrence of unregulated contaminants in drinking water and whether new regulations are warranted. The first Unregulated Contaminants Monitoring Rule (UCMR1) testing was completed in 2003 for a list of contaminants specified by the USEPA. Unregulated contaminants are those for which the USEPA has not established drinking water standards. UCMR2 testing was conducted between

November 2008 and August 2009, and UCMR3 assessment monitoring was conducted between January 2013 and December 2016. The fourth cycle (UCMR4) began in January 2018 and is in various stages of implementation through December 2020. The results from the UCMR monitoring are reported directly to the USEPA. The results of this monitoring are incorporated in the data tables in this report as appropriate. For more information, contact our Customer Service Center at (888) 237-1333.

LEAD

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. California American Water is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking.

If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/lead.

TESTING LEAD IN PUBLIC SCHOOLS

To safeguard water quality in California's K-12 public schools, California Assembly Bill 746 requires community water system to test lead levels, by July 1, 2019, in drinking water at all California public, K-12 school sites that were constructed before January 1, 2010. California American Water serves 14 public school sites (in the Sacramento City District) in the Suburban-Rosemont water system and has completed the testing at all sites. California law makes school districts responsible for informing parents of lead testing results for their schools. Please contact your child's school or school district to get detailed results on lead testing at your child's school.

CRYPTOSPORIDIUM

Cryptosporidium is a microbial pathogen found in surface waters throughout the U.S. Although filtration removes Cryptosporidium, the most commonly used filtration methods cannot guarantee 100% removal. Monitoring indicates the presence of these organisms in source water and/or finished water. Current test methods do not allow us to determine if the organisms are dead or if they are capable of causing disease. Ingestion of Cryptosporidium may cause cryptosporidiosis, an abdominal infection. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can

overcome the disease within a few weeks. However, immunocompromised people are at greater risk of developing life-threatening illness. We encourage immunocompromised individuals to consult their health care provider regarding appropriate precautions to take to avoid infection. Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water. You can obtain more information on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants by calling the USEPA's Safe Drinking Water Hotline (800) 426-4791.

NITRATES

Nitrates in drinking water at levels above 10 mg/L is a health risk for infants of less than six months of age. Such nitrate levels in drinking water can interfere with the capacity of the infant's blood to carry oxygen, resulting in a serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate levels above 10 mg/L may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with certain specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should ask advice from your health care provider.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline at (800) 426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants may be particularly at risk for infections. These people should seek advice about drinking water from their health care providers. USEPA/CDC guidelines on appropriate means to lessen the risk of infection by microbial contaminants are available through the USEPA's Safe Drinking Water Hotline at (800) 426-4791.

Water is sampled and tested consistently throughout the year to ensure the best possible quality. Contaminants are measured in:

- Parts per million (ppm) or milligrams per liter (mg/L)
- Parts per billion (ppb) or micrograms per liter (µg/L)
- Parts per trillion (ppt) or nanograms per liter (ng/L)
- Grains per gallon (grains/gal) A measurement of water hardness often used for sizing household water softeners. One grain per gallon is equal to 17.1 mg/L of hardness.
- MicroSiemens per centimeter (μS/cm) A measurement of a solution's ability to conduct electricity.
- Nephelometric Turbidity Units (NTU) A measurement of the clarity of water. Turbidity in excess of 5 NTU is noticeable to the average person.
- PicoCuries per liter (pCi/L) A measurement of radioactivity in water.

PARTS PER MILLION: PARTS PER BILLION: PARTS PER TRILLION:

1 second 1 second 1 second in 32 years in 32,000 years

1 second 1 second 32,000 days years years

California American Water conducts extensive monitoring to ensure that your water meets all water quality standards. The results of our monitoring are reported in the following tables. While most monitoring was conducted in 2018, certain substances are monitored less than once per year because the levels do not change frequently. For help with interpreting this table, see the "Definition of Terms" section.

- 1 Starting with a **Substance**, read across.
- **2** Year Sampled is usually in 2018 or year prior.
- 3 MCL shows the highest level of substance (contaminant) allowed.
- 4 MCLG is the goal level for that substance (this may be lower than what is allowed).
- **5** Average Amount Detected represents the measured amount (less is better).
- **6** Range tells the highest and lowest amounts measured.
- **7** A **No** under **Violation** indicates government requirements were met.
- 8 Major Sources in Drinking Water tells where the substance usually originates.

Unregulated substances are measured, but maximum allowed contaminant levels have not been established by the government.

Water Quality Results

Regulated Substances

		MCL	PHG (MCLG)	Suburban-Rosemont			City of Sacramento				
Substance (Units)	Year Sampled			Average	Rang	(e	Average	Range	Violation	Major Sources in Drinking Water	
				Amount Detected	Low	High	Amount Detected	Low - High			
Arsenic (ppb)	2018	10	0.004	ND	ND	3.0	ND	ND	No	Erosion of natural deposits; runoff from orchards; Glass, and electronics production wastes	
Barium (ppm)	2018	1	2	ND	ND	0.2	ND	ND	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits.	
Fluoride (ppm)	2018	2	1	ND	ND	0.6	ND	ND	No	Erosion of natural deposits; discharge from fertilizer and aluminum factories	
Nickel (ppb)	2018	100	12	ND	ND	10	ND	ND	No	Erosion of natural deposits; discharge from metal factories	
Nitrate (as nitrogen) (ppm)	2018	10	10	2.6	ND	6.2	ND	ND	No	Runoff and leaching from fertilizer use; Leaching from septic tanks and sewage; Erosion of natural deposits	
1,2-Dibromo-3-chloropropane (DBCP) (ppt)	2018	200	1.7	ND	ND	30	NR	NR	No	Banned nematocide that may still be present in soils due to runoff/leaching from former use on soybeans, cotton, vineyards, tomatoes, and tree fruit	
Gross Alpha Particle Activity (pCi/L)	2012-2018	15	(0)	ND	ND	8.6	ND	ND	No	Erosion of natural deposits	
Uranium (pCi/L)	2011-2016	20	0.43	2.1	ND	4.1	NR	NR	No	Erosion of natural deposits	
Control of Disinfection By-Product Precursors (TOC) (removal ratio)	2018	TT = ≥1.0 ¹	NA	NA ²	NA		1	L.O	No	Various natural and man-made sources	

Removal ratio greater than or equal to 1.0 indicates that TOC removal requirements were met or exceeded

Distribution System Monitoring (Suburban-Rosemont service area)

Chlorine (ppm)	2018	MRDL=4.0	MRDLG=4.0	0.7	0.2	2.0	0.6	ND - 1.3	No	Treatment chemical used to disinfect drinking water
Fluoride (ppm) ³	2018	0.6 - 1.2 4	NA	0.84	0.60	1.6	0.7	0.3 - 0.9	No	Water additive that promotes strong teeth
Haloacetic Acids (ppb) ⁵	2018	60	NA	6	ND	24	34	ND - 45	No	By-product of drinking water disinfection
Total Trihalomethanes (TTHM)(ppb) 5	2018	80	NA	11	ND	42	59	ND - 79	No	By-product of drinking water disinfection
Total Coliform Bacteria (% positive)	2018	Highest Amount Allowed 5%	0%		0%	0.4%		4%	No	Naturally present in the environment

³ California American Water adjusts the natural levels of fluoride in our water supplies to the State Water Resources Control Board, Division of Drinking Water's recommended optimum level.

Secondary Substances

Secondary Substances			Sub	ourban-Rosemo	nt	City of Sacramento				
Substance (Units)	Year Sampled	SMCL 6	Average Amount	Range		Average Amount	Range	Violation	Typical Source	
			Detected	Low	High	Detected	Low - High			
Chloride (ppm)	2017-2018	500	9	1.9	33	ND	ND - 5.0	No	Runoff/leaching from natural deposits; Seawater influence	
Color (units)	2018	15	ND	ND	ND	ND	ND - 5	No	Naturally-occurring organic materials	
Iron (ppb)	2018	300	ND	ND	42	ND	ND	No	Leaching from natural deposits; Industrial wastes	
Manganese (ppb)	2017-2018	50	ND	ND	66	ND	ND	No	Leaching from natural deposits	
Odor (TON)	2018	3	ND	ND	1	ND	ND - 2	No	Naturally-occurring organic materials	
Specific Conductance (umhos/cm)	2017-2018	1600	260	84	750	114	89 - 139	No	Substances that form ions when in water; Seawater influence	
Sulfate (ppm)	2017-2018	500	10	ND	32	10	7.2 - 13	No	Runoff/leaching from natural deposits; Industrial wastes	
Total Dissolved Solids (ppm)	2017-2018	1000	187	40	450	62	49 - 74	No	Runoff/leaching from natural deposits	
Turbidity (NTU)	2018	5	0.4	ND	2	ND	ND - 1	No	Soil runoff	
Vanadium (ppb) ⁷	2018	50 ⁸	10	ND	13	ND	ND	No	Naturally Occurring Metal	
Zinc (ppm)	2018	5.0	ND	ND	0.2	ND	ND	No	Runoff/leaching from natural deposits; industrial wastes	

⁶ Secondary MCLs are set to protect the odor, taste, and appearance of drinking water. These contaminants are not considered to present a risk to human health at the SMCL.

Turbidity - A Measure of the Clarity of the Water (at the City of Sacramento Treatment Facility)

Substance (Units)	Year Sampled	MCL	PHG (MCLG)	Highest Single Measurement	Violation	Typical Source
Turbidity (NTU)	2018	TT = 1 NTU		0.10		Soil runoff
		Minimum 95% of samples <0.3	NA NA	100.0%	No	

Lead and Copper (tap water samples from Suburban - Rosemont System only)

Substance (units)	Year Sampled	Action Level	PHG (MCLG)	Number of Samples	Amount Detected at 90th Percentile	Homes Above Action Level	Violation	Typical Source
Copper (ppm)	2016	1.3	0.3	30	0.123	0		Internal corrosion of household plumbing systems; Erosion of natural deposits; Leaching from wood preservatives
Lead (ppb)	2016	15	0.2	30	1	0		Internal corrosion of household plumbing systems; Erosion of natural deposits; Discharges from industrial manufacturers

²Only surface water sources must comply with PDWS for Control of Disinfection By-Product Precursors and turbidity.

⁴ Fluoride Control Range, not an MCL.

⁵ Compliance is based on the Locational Running Annual Average. The highest level reported in the range is the result of an individual sample. The "Average Amount Detected" is the Highest Running Annual Average.

⁷The babies of some pregnant women who drink water containing vanadium in excess of the notification level may have an increased risk of developmental effects, based on studies in laboratory animals.

⁸Notification Level, not a secondary MCL.

Unregulated Substances (Measured on the Water Leaving the Treatment Facility or within the Distribution System)

- Instantian Charles (Instantia	Year Sampled	Suburban-Rosemont				of Sacramento			
Substance (units)		Average	Ran	ge	Average	Range	Notes		
(units)		Amount Detected	Low	High	Amount Detected	Low - High			
1,4-Dioxane (ppb)	2014 - 2015	ND	ND	0.08	ND	NA	Some people who use water containing 1.4-dioxane in excess of the Notification Level (1 ppb) over many years may experience liver or kidney problems and may have an increased risk of getting cancer, based on studies in laboratory animals.		
4-androstene-3,17-dione (ppb)	2014 - 2015	NA	NA	NA	ND	ND - 0.00034	Steroidal hormone naturally produced in the human body; and used as an anabolic steroid and a dietary supplement		
Bromochloromethane	2014 - 2015	ND	ND	ND	ND	ND	Used as a fire-extinguishing fluid, an explosive suppressant, and as a solvent in the manufacturing of pesticides		
Chlorate (ppb)	2014 - 2015	167	ND	1180	ND	ND - 61	Oxidant used in pyrotechnics and possible by-product of water treatment		
Chlorodifluoromethane (ppb)	2014 - 2015	ND	ND	0.12	ND	ND	Used as a refrigerant, as a low-temperature solvent, and in fluorocarbon resins		
Chloromethane (ppb)	2014 - 2015	0.02	ND	0.40	ND	ND	Used as foaming agent, in production of other substances; byproduct of water disinfection		
Chromium (ppb)	2014 - 2015	3.5	ND	6.1	ND	ND	Runoff/leaching from natural deposits or discharge from Industrial Facilities		
Chromium Hexavalent (ppb)	2014 - 2017	3.2	ND	5.5	ND	NA	Runoff/leaching from natural deposits or discharge from Industrial Facilities		
Molybdenum (ppb)	2014 - 2015	0.14	ND	1.9	ND	ND - 1	Naturally-occurring element found in ores and present in plants, animals and bacteria; commonly used form molybdenum trioxide used as a chemical reagent		
Strontium (ppb)	2014 - 2015	301	ND	1000	76	48 - 130	Naturally-occurring element		
Testosterone (ppb)	2014 - 2015	NA	NA	NA	ND	ND - 0.00026	Naturally Occurring Metal		
Vanadium (ppb)	2014 - 2015	11	ND	17	1.4	0.4-3	The babies of some pregnant women who drink water containing vanadium in excess of the Notification Level (50 ppb) may have an increased risk of developmental effects, based on studies in laboratory animals.		

Additional Constituents

This table shows average levels of additional water quality parameters that are often of interest to consumers. The averages shown are calculated from the levels detected at each source used to supply water is 2018. Values may vary from day-to-day. There are no health-based limits for these substance in drinking water.

Substance (Units)			Suburban-Rosemont	City of Sacramento		
	Year Sampled	Average Amount Detected		tange	Average Amount Detected	Range
		Alfologo Allioulit Botostou	Low	High	Avoidgo Alloulit Dotostou	Low - High
Alkalinity as CaCO3 (ppm)	2018	98	36	290	36	25 - 36
Calcium (ppm)	2018	26	8.9	29	13	11 - 15
Magnesium (ppm)	2018	10.0	3.5	32	3.4	2.2 - 4.5
рН	2018	7.8	7.3	8.4	NA	NA
Silica (ppm)	2018	46	30	59	NA	NA
Sodium (ppm)	2018	13	4.8	27	4.2	2.2 - 6.1
Total Hardness as CaCO3 (ppm)	2018	101	30	330	45	36 - 54
Total Hardness as CaCO3 (grains/gallon)	2018	5.9	1.8	19	2.6	2.1 - 3.2

[&]quot;Hardness" is the sum of polyvalent cations present in the water, generally magnesium and calcium. The cations are usually naturally occurring.

[&]quot;Sodium" refers to the salt present in the water and is generally naturally occurring.

if exceeded, triggers treatment or other requirements, that a DDW and the consumer. Not an enforceable standard. water system must follow.

DDW: Division of Drinking Water

LRAA: Locational Running Annual Average

Maximum Contaminant Level (MCL): The highest level of a as close to the MCLGs as feasible using the best available treatment technology. Secondary MCLs (SMCL) are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL): The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

MFL: Million fibers per liter.

micromhos per centimeter (µmhos/cm): A measure of electrical conductance.

NA: Not applicable N/A: No data available

ND: Not detected NR: Not required

Nephelometric Turbidity Units (NTU): Measurement of the clarity, or turbidity, of the water.

Notification Level (NL): The concentration of a

Action Level (AL): The concentration of a contaminant, which, contaminant, which, if exceeded, requires notification to

pH: A measurement of acidity, 7.0 being neutral.

picocuries per liter (pCi/L): Measurement of the natural rate of disintegration of radioactive contaminants in water (also beta particles).

contaminant that is allowed in drinking water. MCLs are set parts per billion (ppb): One part substance per billion parts water, or micrograms per liter.

> parts per million (ppm): One part substance per million parts water, or milligrams per liter.

parts per trillion (ppt): One part substance per trillion parts water, or nanograms per liter.

Primary Drinking Water Standard (PDWS): MCLs for contaminants that affect health along with their monitoring and reporting requirements and water treatment requirements.

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California EPA.

RAA: Running Annual Average

Secondary Maximum Contaminant Level (SMCL): Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

SWRCB: State Water Resources Control Board

TON: Threshold Odor Number

Total Dissolved Solids (TDS): An overall indicator of the amount of minerals in water.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Variances and Exemptions: State or USEPA permission not to meet an MCL or utilize a treatment technique under certain conditions.

%: Percent
