

APPENDIX B: eCCR Certification Form (Suggested Format)

Consumer Confidence Report Certification Form

(To be submitted with a copy of the CCR)

Water System Name:	City of San José – North San José/Alviso, Evergreen, Edenvale and Coyote
Water System Number:	CA4310019 & CA4310020

The water system named above hereby certifies that its Consumer Confidence Report was distributed on June 23, 2026 (date) to customers (and appropriate notices of availability have been given). Further, the system certifies that the information contained in the report is correct and consistent with the compliance monitoring data previously submitted to the State Water Resources Control Board, Division of Drinking Water (DDW).

Certified by:

Name: Roger Cox	Title: Associate Engineer
Signature: 	Date: 6/23/2026
Phone number: 408-439-1494	

To summarize report delivery used and good-faith efforts taken, please complete this page by checking all items that apply and fill-in where appropriate:

- ☒ CCR was distributed by mail or other direct delivery methods (attach description of other direct delivery methods used).
- ☒ CCR was distributed using electronic delivery methods described in the Guidance for Electronic Delivery of the Consumer Confidence Report (water systems utilizing electronic delivery methods must complete the second page).
- ☒ "Good faith" efforts were used to reach non-bill paying consumers. Those efforts included the following methods:
 - ☒ Posting the CCR at the following URL: www.sjenvironment.org/waterquality
 - ☐ Mailing the CCR to postal patrons within the service area (attach zip codes used)
 - ☒ Advertising the availability of the CCR in news media (attach copy of press release)
 - ☐ Publication of the CCR in a local newspaper of general circulation (attach a copy of the published notice, including name of newspaper and date published)
 - ☐ Posted the CCR in public places (attach a list of locations)

- ☐ Delivery of multiple copies of CCR to single-billed addresses serving several persons, such as apartments, businesses, and schools
- ☐ Delivery to community organizations (attach a list of organizations)
- ☐ Publication of the CCR in the electronic city newsletter or electronic community newsletter or listserv (attach a copy of the article or notice)
- ☒ Electronic announcement of CCR availability via social media outlets (attach list of social media outlets utilized)
- ☒ Other (attach a list of other methods used)
- ☒ *For systems serving at least 100,000 persons:* Posted CCR on a publicly-accessible internet site at the following URL: www.sjenvironment.org/waterquality
- ☐ *For privately-owned utilities:* Delivered the CCR to the California Public Utilities Commission

Consumer Confidence Report Electronic Delivery Certification

Water systems utilizing electronic distribution methods for CCR delivery must complete this page by checking all items that apply and fill-in where appropriate.

- ☒ Water system mailed a notification that the CCR is available and provides a direct URL to the CCR on a publicly available website where it can be viewed (attach a copy of the mailed CCR notification). URL: www.sjenvironment.org/waterquality
- ☐ Water system emailed a notification that the CCR is available and provides a direct URL to the CCR on a publicly available site on the Internet where it can be viewed (attach a copy of the emailed CCR notification). URL: www._____
- ☐ Water system emailed the CCR as an electronic file email attachment.
- ☐ Water system emailed the CCR text and tables inserted or embedded into the body of an email, not as an attachment (attach a copy of the emailed CCR).
- ☐ *Requires prior DDW review and approval.* Water system utilized other electronic delivery method that meets the direct delivery requirement.

Provide a brief description of the water system's electronic delivery procedures and include how the water system ensures delivery to customers unable to receive electronic delivery.

Each customer was sent a postcard by mail notifying them of the availability of the CCR
online and that a hard copy can be mailed out by request. The postcard has a direct
URL weblink along with a scannable QR code. Other means of outreach include:

• CCR URL link included in customers billing statements
• Posted digital ads in the <i>SJ Mercury News</i> and <i>Evergreen Times</i>
• Posted in department's social media outlets (Facebook and Instagram)
• Dropped off copies of the CCR to public libraries and community center within service area - Evergreen Library, 2635 Aborn Rd. - Alviso Library, 5050 N. 1st St. - Evergreen Community Center, 4860 San Felipe Rd. - Village Square Branch Library, 4001 Evergreen Village Square

This form is provided as a convenience and may be used to meet the certification requirement of section 64483(c) of the California Code of Regulations.

2025 Water Quality Report

**SAN JOSÉ MUNICIPAL
WATER SYSTEM**

The San José Municipal Water System is dedicated to providing a safe, clean and reliable source of drinking water to our customers.

Customers in the Evergreen, Alviso/North San José, Edenvale or Coyote Valley service areas can learn more about their drinking water by reading the 2025 Annual Water Quality Report online at **SJEnvironment.org/WaterQuality**

If you would like a paper copy of the 2025 Annual Water Quality Report, or if you would like to speak to someone about the quality of your water, please call a Water Quality Engineer at 408-277-3671.

2025 Water Quality Report

INFORME DE CALIDAD DEL AGUA DE 2025 · BÁO CÁO CHẤT LƯỢNG NƯỚC NĂM 2025

The 2025 San José Municipal Water System water quality report is a summary of last year's water quality information. It will tell you where your water comes from and how it compares to drinking water standards set by the U.S. Environmental Protection Agency and State Water Resources Control Board.

*This report contains important facts and Information about your drinking water.

A Message from the U.S. Environmental Protection Agency

Across America, the sources of both tap and bottled drinking water include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or human activity. Contaminants that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants**, such as salts and metals, can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides**, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals that are byproducts of industrial processes and petroleum production, which can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- **Radioactive contaminants**, which can be naturally occurring or result from oil and gas production and mining activities.

To ensure that tap water is safe to drink, the EPA and SWRCB prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. SWRCB regulations also establish limits for contaminants in bottled water that must provide the same protection for public health.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV and AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their healthcare providers. EPA and Centers for Disease Control guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline at 800-426-4791.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline at 800-426-4791.

Safeguarding Your Water Supply

Protecting our water supply is important to ensure that water is safe from contamination and aesthetically pleasing for use. Protection begins in the watersheds, where people and their activities can be a major cause of source contamination. Contamination requires additional treatment, which increases the cost to deliver water to your tap.

Participating in public meetings and forums regarding water issues enables decision-makers to hear your perspective and allows you to be directly involved in protecting your water supply. Visit SanJoseca.gov/CouncilAgenda for San José City Council meeting agendas.

Understanding that drinking water, including bottled water, may reasonably be expected to contain at least minute amounts of contaminants will help you make an informed choice about your

drinking water. The presence of contaminants does not necessarily indicate a health risk.

The Source of Your Water

The San José Municipal Water System (Muni Water) serves the North San José, Alviso, Evergreen, Edenvale and Coyote Valley communities of the City of San José. The source of your water depends on the service area in which you are located.

■ North San José/Alviso Service Area

Muni Water purchases a blend of Hetch Hetchy water and treated water from the San Francisco Public Utilities Commission (SFPUC) and delivers it to our Alviso and North San José customers. In 2025, the Hetch Hetchy Watershed provided most of the total SFPUC water supply, supplemented by local watersheds in Alameda and Santa Clara counties. The major water source originates from spring snowmelt flowing down the Tuolumne River to the Hetch Hetchy Reservoir, where it is stored. Since this water source meets all federal and state criteria for watershed protection, disinfection treatment practices, bacteriological quality monitoring, and high operational standards, the EPA and state of California have granted this water source a filtration exemption.

The Alameda Watershed spans more than 35,000 acres in Alameda and Santa Clara counties. Surface water from rainfall and runoff is collected in the Calaveras and San Antonio reservoirs. Prior to distribution, the water from these reservoirs is treated at the Sunol Valley Water Treatment Plant (SVWTP). Filtration, disinfection, fluoridation and corrosion control treatment are provided for the combined Hetch Hetchy and SVWTP water at the Sunol Chloramination and Fluoridation facilities.

The SFPUC actively and aggressively protects the natural water resources entrusted to its care. An annual report on the Hetch Hetchy Watershed reflects the evaluation of its sanitary conditions, water quality and potential contamination sources. The report also presents performance results of watershed management activities implemented by the SFPUC and partner agencies to reduce or eliminate potential contamination sources. The SFPUC also conducts sanitary surveys of the local watersheds every five years. These surveys identified wildlife, livestock and human activities as potential contamination sources. You may contact the San Francisco office of the State Water Resources Control Board's Division of Drinking Water at 510-620-3474 for review of these reports.

In 2025, groundwater from local deep-water wells in North San José was utilized to supplement the SFPUC supply. With this additional water source, some customers may have received a blend of groundwater and SFPUC water. A slight difference in taste and odor may have been noticed, since groundwater generally has a higher mineral content than surface water.

Muni Water conducted a one-time source water assessment of the wells in January 2003.*

■ Evergreen Service Area

Muni Water purchases treated surface water from Valley Water (formerly known as the Santa Clara Valley Water District) and delivers it to our Evergreen customers. Valley Water's surface water is mainly imported from the South Bay Aqueduct, Dyer Reservoir, Lake Del Valle and San Luis Reservoir, which all draw water from the Sacramento-San Joaquin Delta watershed. Valley Water local surface water sources include Anderson and Calero

reservoirs. Water from imported and local sources is pumped to and treated at three water treatment plants located in San José.

Since 2006, Valley Water has used ozone as the primary disinfectant. Ozone disinfection is highly effective at inactivating microbial contaminants and creates fewer disinfection by-products than chlorine. Ozone also effectively removes negative tastes and odors often caused by seasonal algal blooms in the Delta source waters.

Valley Water's source waters are vulnerable to potential contamination from a variety of land use practices, such as agricultural and urban runoff, recreational activities, livestock grazing, and residential and industrial development. Imported sources are additionally vulnerable to wastewater treatment plant discharges, seawater intrusion, and wildfires in open space areas. Local sources are additionally vulnerable to contamination from commercial stables and historic mining practices. No contaminant associated with any of these activities has been detected in Valley Water's treated water. The water treatment plants provide multiple barriers for physical removal and disinfection of contaminants. For additional information, visit the Valley Water website at ValleyWater.org.

During 2025, Muni Water utilized groundwater from local deep-water wells to supplement Valley Water's supply. Some customers may have received a blend of groundwater and Valley Water's treated water. A slight difference in taste and odor may have been noticed, since groundwater generally has a higher mineral content than surface water. Muni Water conducted a source water assessment for the Evergreen wells in December 2014.*

■ Edenvale Service Area

Groundwater from deep-water wells provides 100 percent of the supply for the Edenvale service area. Muni Water conducted a one-time source water assessment for the Edenvale wells in January 2003.* Although the source is considered potentially vulnerable to chemical and petroleum processing activities, no contaminants associated with these activities have been detected.

■ Coyote Valley Service Area

Groundwater from deep-water wells provides 100 percent of the supply for this service area. An assessment of these wells was conducted in June 2004,* and potable use of the groundwater began in 2005. Although the source is considered potentially vulnerable to agricultural drainage, unauthorized dumping, storage tank leaks, and sewer collection systems, no contaminants associated with these activities have been detected.

**For information about the type of contaminants tested or to get a copy of the groundwater well assessment reports for your service area, please contact a Water Quality Engineer at 408-277-3671.*

Water Quality

Coliforms, reported as “Total Coliform,” are bacteria that are naturally present in the environment and are used as an indicator that other, potentially harmful, waterborne pathogens may be present or that a potential pathway exists through which contamination may enter the drinking water distribution system.

Disinfection of surface water is necessary to destroy disease-causing organisms for the protection of public health. In Evergreen, North San José and Alviso, water is disinfected using chloramine. Except for a slight chlorinous taste or odor, chloramine is not harmful to the general public. However, it must be removed for kidney dialysis machines and aquariums. If you are receiving kidney dialysis treatment, please contact your doctor or dialysis technician. For pet fish, contact your local fish store for more information about special water treatment.

Fluoride is added to the treated water supplies in Evergreen, North San José and Alviso to help prevent dental cavities in consumers.

In Evergreen, Muni Water began fluoridating the treated water it received from Valley Water following an Evergreen community advisory vote in the early 1960s. Valley Water became responsible for fluoridating the water supply in 2016 and now provides fluoridation of the water supply at their water treatment plants.

SFPUC has been fluoridating its water supplies since November 2005. The fluoride levels in the treated water are maintained within the range required by state regulations.

In 2025, some areas of Evergreen, North San José and Alviso may have received a blend of treated water and non-fluoridated groundwater. As a result, some customers periodically received water with fluoride levels slightly below the recommended range.

At present, additional fluoride is not added in Edenvale or Coyote Valley service areas. Consult your doctor or dentist if you are considering additional fluoride supplements or treatments.

Hardness consists mainly of calcium and magnesium salts. Although it does not pose a health risk, it may be considered undesirable for other reasons. Some benefits to reducing hardness by using water softeners are reductions in soap usage, longer life for water heaters, and less incrustation of pipes. Some disadvantages are an increase

in sodium intake (depending on the type of softener used), proper maintenance and servicing requirements, and potential adverse effects on plants and landscaping.

Turbidity is a measure of the water’s cloudiness. It is monitored because it is a good indicator of the effectiveness of the water treatment process. The turbidity standard for unfiltered supplies (e.g., Hetch Hetchy) is 5 NTU. The turbidity for filtered water supplies (e.g., Valley Water treated water) must be less than 0.3 NTU 95 percent of the time and at no time higher than 1 NTU.

Cryptosporidium and Giardia lamblia are parasitic microbes found in most surface water. The SFPUC and Valley Water regularly test for these waterborne pathogens and found them at very low levels in source water and/or treated water in 2025. However, current test methods approved by the United States Environmental Protection Agency do not distinguish between dead organisms and those capable of causing disease. Ingestion of these microbes may produce symptoms of nausea, abdominal cramps, diarrhea, and associated headaches. Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water.

Lead, if present at elevated levels, can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Muni Water is responsible for providing high-quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 800-426-4791 or at [EPA.gov/safewater/lead](https://www.epa.gov/safewater/lead).

UCMR5 is the EPA’s Unregulated Contaminant Monitoring Rule. Once every five years, the EPA issues a new list of unregulated contaminants to be monitored by public water systems. This monitoring provides a basis for future regulatory actions to protect public health. Muni Water monitored for 30 contaminants under the fifth cycle of the Unregulated Contaminant Monitoring Rule (UCMR5) during 2023. Only one of the 30 contaminants (lithium) was detected, and is included in the data table within this report.

2025 Water Quality Data

Water at various locations in the distribution system is tested by certified City staff and a private, state-certified laboratory using the latest testing procedures and equipment. During 2025, numerous tests were conducted on samples taken from the distribution system. In addition to these tests, Valley Water and SFPUC perform their own water quality analyses of the source and treated water.

Test results from the distribution system and source water analyses are shown in the table at right. Some of the data, though representative, are more than one year old. SWRCB allows monitoring for some constituents less than once per year since their concentrations do not change frequently.

Lab analysis was also performed for many constituents other than those listed in the tables; only those constituents detected in the tap water are shown. For a complete list of all the constituents analyzed or any questions about this report, please contact a Water Quality Engineer at 408-277-3671.

* Temporary chlorination was performed in the Edenvale service area during May and November 2025 for maintenance purposes. No chlorine was present in the service area during the remainder of the year.
** Temporary chlorination was performed in the Coyote service area during May and November 2025 for maintenance purposes. No chlorine was present in the service area during the remainder of the year.

- NOTES:
a Distribution system data in 2023.
b Distribution system data in 2025. Running averages are calculated from data for previous quarters that are not shown in this table.
c Distribution system data in 2025.
d Filtered water turbidity required to be < 0.3 NTU in 95% of samples. All filtered water sources met this standard.
e Distribution system customer data in 2024.
f To convert hardness from ppm to grains per gallon, divide by 17.1.
- TYPICAL SOURCES IN DRINKING WATER:
1 Erosion of natural deposits
2 Water additive that promotes strong teeth
3 Runoff/leaching from fertilizers
4 By-product of drinking water disinfection
5 Added for disinfection
6 Naturally present in the environment
7 Soil runoff
8 Internal corrosion of household plumbing systems
9 Runoff/leaching of natural deposits
10 Seawater influence
11 Naturally-occurring organic material
12 Industrial waste
13 Substances forming ions in water
14 Various natural and manmade sources
15 Residue from some surface water treatment processes

See back panel for definitions and abbreviations used in this table.

Continue Making Water Efficiency a Way of Life

Your commitment to using water wisely has made a difference! From 2020 to 2025, average residential water use per person in the San José Municipal Water service area has shown a commendable reduction, decreasing from 71 gallons to 51 gallons per day. This decrease reflects the public's growing commitment to water conservation. Your efforts have been key to this positive change, showing that collective action leads to meaningful progress.

Leaks are one of the most common sources of everyday water waste. The City of San José encourages customers to regularly check for leaks both indoors and outdoors. For more information and helpful guidance on how to check for a home water leak, please visit SJEnvironment.org/Fix-Leaks.

For water-efficiency tips and a complete list of our current water use rules, please visit SJEnvironment.org/WaterEfficiency or call 408-277-3671. Keep up the great work!

Ensuring Safe, Clean Water for Everyone

Our backflow prevention and cross-connection control program is designed to protect the public water supply from contamination and pollution. Visit SJEnvironment.org/BackflowPrevention to learn more about how backflow can happen, what a cross-connection is, and how we can work together to keep our water safe.

About Us

The San José Municipal Water System is a City-owned water utility that has served customers since 1961. We are committed to delivering a reliable water supply that meets or exceeds all drinking water health standards.

Please contact us from 8 a.m.-5 p.m., Monday through Friday (closed holidays) for any questions or inquiries. For more information, visit our website at SJEnvironment.org/MuniWater or call 408-535-3500 (translation services are available).

In accordance with the Americans with Disabilities Act, City of San José Environmental Services Department materials can be made available upon request in alternative formats, such as Braille, large print, audiotape or computer disk. Requests may be made by calling 408-277-3671 (voice),

The City of San José is committed to open and honest government and strives to consistently meet the community's expectations by providing excellent service, in a positive and timely manner, and in the full view of the public.

Definitions

AL (Regulatory Action Level)

The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

MCL (Maximum Contaminant Level)

The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technically feasible. Secondary MCLs are set to protect the odor, taste and appearance of drinking water.

MCLG (Maximum Contaminant Level Goal)

The level of a contaminant in drinking water below which there is no known or expected risk to health. The EPA sets MCLGs.

MRDL (Maximum Residual Disinfectant Level)

The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

MRDLG (Maximum Residual Disinfectant Level Goal)

The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

NL (Notification Level)

Health-based advisory levels established by the SWRCB for chemicals in drinking water that lack maximum contaminant levels.

PDWS (Primary Drinking Water Standard)

MCLs and MRDLs for contaminants that affect health along with their monitoring, reporting, and water treatment requirements.

PHG (Public Health Goal)

The level of a contaminant in drinking water below which there is no known or expected risk to health. The California Environmental Protection Agency sets PHGs.

Source Water

Raw water that has not been treated to meet drinking water standards.

Treated Water

Water that has been treated to meet EPA and SWRCB drinking water standards.

Treatment Technique

A required process intended to reduce the level of a contaminant in drinking water.

Abbreviations:

<	less than
AL	Action Level
CU	Color Unit
NA	Not Applicable
ND	Not Detected
NS	No Standard
NTU	Nephelometric Turbidity Units
pCi/L	pico Curies per liter
ppb	parts-per-billion (equals 1 microgram per liter (µg/L))
ppm	parts-per-million (equals 1 milligram per liter (mg/L))
TON	Threshold Odor Number
TT	Treatment Technique
µS/cm	microSiemens per centimeter
